DEVELOPING ASSESSMENT RELIABILITY AND VALIDITY: ITEM ANALYSIS

Readily available analysis techniques allow us to obtain sophisticated item analysis data for music items

Item Response Theory models should become the standard analysis approach

3 parameter models for dichotomous items which measure difficulty and discrimination while controlling for guessing

Polytomous generalized rating scale models extend IRT theory to the analysis of rubric-based assessments (i.e. Samejima's graded response model)

Easy software programs such as XCalibre4™ make these complex calculations accessible

Frank Baker's classic book, Basics of Item response theory, is now a free ERIC document

Reliability And Validity Assessment:

Reliability and Validity Assessment Edward G. Carmines, Richard A. Zeller, 1979-11 This quide demonstrates how social scientists assess the reliability and validity of empirical measurements This monograph is a good starting point for those who want to familiarize themselves with the current debates over appropriate measurement de A Reliability and Validity Assessment of Scales Measuring the Perception of the Evaluations of Others John A. Validity in Educational and Psychological Assessment Paul Newton, Stuart Shaw, 2014-04-15 Validity is the hallmark of quality for educational and psychological measurement But what does quality mean in this context And to what exactly does the concept of validity apply These apparently innocuous questions parachute the unwary inquirer into a minefield of tricky ideas This book guides you through this minefield investigating how the concept of validity has evolved from the nineteenth century to the present day Communicating complicated concepts straightforwardly the authors answer questions like What does validity mean What does it mean to validate How many different kinds of validity are there When does validation begin and end Is reliability a part of validity or distinct from it This book will be of interest to anyone with a professional or academic interest in evaluating the quality of educational or psychological assessments measurements and Measurement of Nursing Outcomes, 2nd Edition Louise Sherman Jenkins, PhD, RN, Dr. Carolyn F. Waltz, PhD, diagnoses RN, FAAN, 2001-08-03 This is a compendium of over 30 tools for the measurement of professional and educational outcomes in nursing It is a second edition of the award winning series of books on measuring outcomes in nursing The tools and methods are presented with attention to purpose and utility conceptual basis development testing and reliability and validity assessments Major topic areas focus on clinical decision making and performance in education and practice student outcomes and research In most cases the complete measurement instrument is included in the book Inter-Rater Reliability Testing of Quality Assessment Instruments U. S. Department of Health and Human Services, Agency for Healthcare Research and Quality, 2013-04-09 The internal validity of a study reflects the extent to which the design and conduct of the study have prevented bias es One of the key steps in a systematic review is assessment of a study s internal validity or potential for bias This assessment serves to 1 identify the strengths and limitations of the included studies 2 investigate and potentially explain heterogeneity in findings across different studies included in a systematic review and 3 grade the strength of evidence for a given question The risk of bias assessment directly informs one of four key domains considered when assessing the strength of evidence With the increase in the number of published systematic reviews and development of systematic review methodology over the past 15 years close attention has been paid to the methods for assessing internal validity Until recently this has been referred to as quality assessment or assessment of methodological quality In this context quality refers to the confidence that the trial design conduct and analysis has minimized or avoided biases in its treatment comparisons To facilitate the assessment of methodological quality a plethora of tools has emerged Some of these tools were developed for specific study designs e g randomized controlled trials RCTs cohort studies case control studies while others were intended to be applied to a range of designs The tools often incorporate characteristics that may be associated with bias however many tools also contain elements related to reporting e.g. was the study population described and design e g was a sample size calculation performed that are not related to bias The Cochrane Collaboration recently developed a tool to assess the potential risk of bias in RCTs The Risk of Bias ROB tool was developed

to address some of the shortcomings of existing quality assessment instruments including over reliance on reporting rather than methods Several systematic reviews have catalogued and critiqued the numerous tools available to assess methodological quality or risk of bias of primary studies In summary few existing tools have undergone extensive interrater reliability or validity testing Moreover the focus of much of the tool development or testing that has been done has been on criterion or face validity Therefore it is unknown whether or to what extent the summary assessments based on these tools differentiate between studies with biased and unbiased results i e studies that may over or underestimate treatment effects There is a clear need for interrate reliability testing of different tools in order to enhance consistency in their application and interpretation across different systematic reviews Further validity testing is essential to ensure that the tools being used can identify studies with biased results Finally there is a need to determine interrater reliability and validity in order to support the uptake and use of individual tools that are recommended by the systematic review community and specifically the ROB tool within the Evidence based Practice Center EPC Program In this project we focused on two tools that are commonly used in systematic reviews The Cochrane ROB tool was designed for RCTs and is the instrument recommended by The Cochrane Collaboration for use in systematic reviews of RCTs The Newcastle Ottawa Scale is commonly used for nonrandomized studies specifically cohort and case control studies **Measurement and Evaluation for Health** Educators Manoj Sharma, Rick Lingyak Petosa, 2014 Measurement and Evaluation for Health Educators prepares health educators for the responsibilities of conducting evaluations within their field It includes psychometric statistical political managerial and public health perspectives to measurement and evaluation Written for the undergraduate or beginning graduate student as well as practicing professions this text will help readers choose and develop instruments for evaluation and discusses the basics for carrying out evaluations to gauge the effectiveness of health education and health promotion programs Measurement and Evaluation for Health Educators also delves into the basics of measurement steps in instrument development reliability assessment validity assessment measurement errors process evaluation designs for quantitative evaluation and much more Key Features Student friendly accessible writing style Each chapter closes with review questions and web references Chapter objectives and key learning objectives are clearly defined Includes skill building activities in every chapter Boxed articles throughout the text highlight important issues in the field **Assessment of Couples and Families** Len Sperry, 2004 This book represents an up to date comprehensive survey of the major contemporary and cutting edge tools and strategies used in the clinical assessment of couples and families Partial Least Squares Structural Equation Modeling (PLS-SEM) Using R Joseph F.
