Introduction to Reliable Distributed Programming Rachid Guerraoui, Luís Rodrigues, 2006-05-01 In modern computing a program is usually distributed among several processes The fundamental challenge when developing reliable distributed programs is to support the cooperation of processes required to execute a common task even when some of these processes fail Guerraoui and Rodrigues present an introductory description of fundamental reliable distributed programming abstractions as well as algorithms to implement these abstractions The authors follow an incremental approach by first introducing basic abstractions in simple distributed environments before moving to more sophisticated abstractions and more challenging environments Each core chapter is devoted to one specific class of abstractions covering reliable delivery shared memory consensus and various forms of agreement This textbook comes with a companion set of running examples implemented in Java These can be used by students to get a better understanding of how reliable distributed programming abstractions can be implemented and used in practice Combined the chapters deliver a full course on reliable distributed programming The book can also be used as a complete reference on the basic elements required to build reliable distributed applications

Databases, Information Systems, and

Peer-to-Peer Computing Wee Siong Ng, Beng Chin Ooi, Aris Ouksel, Claudio Sartori, 2005-02-25 Peer to peer P2P computing promises to offer exciting new possibilities in distributed information processing and database technologies The realization of this promise lies fundamentally in the availability of enhanced services such as structured ways for classifying and registering shared information verification and certification of information content distributed schemes and quality of content security features information discovery and accessibility interoperability and composition of active information services and naturally market based mechanisms to allow cooperative and non cooperative information exchanges The P2P paradigm lends itself to constructing large scale complex adaptive autonomous and heterogeneous database and information systems endowed with clearly specified and differential capabilities to negotiate bargain coordinate and self organize the information exchanges in large scale networks This vision will have a radical impact on the structure of complex organizations business scientific or otherwise and on the emergence and the formation of social communities and on how the information is organized and processed The P2P information paradigm naturally encompasses static and wireless connectivity and static and mobile architectures Wireless connectivity combined with the increasingly small and powerful mobile devices and sensors pose new challenges to as well as opportunities for the database community Information becomes ubiquitous highly distributed and accessible anywhere and at any time over highly dynamic unstable networks with very severe constraints on the information management and processing capabilities

Handbook of Peer-to-Peer Networking Xuemin Shen, Heather Yu, John Buford, Mursalin Akon, 2010-03-03 Peer to peer networking is a disruptive technology for large scale distributed applications that has recently gained wide interest due to the successes of peer to peer P2P content sharing media streaming and telephony applications There are a large range of other applications under development or being proposed The underlying architectures share features such as decentralization sharing of end system resources autonomy virtualization and self organization These features constitute the P2P paradigm This handbook broadly addresses a large cross section of current research and state of the art reports on the nature of this

paradigm from a large number of experts in the field. Several trends in information and network technology such as increased performance and deployment of broadband networking, wireless networking and mobile devices are synergistic with and reinforcing the capabilities of the P2P paradigm. There is general expectation in the technical community that P2P networking will continue to be an important tool for networked applications and impact the evolution of the Internet. A large amount of research activity has resulted in a relatively short time and a growing community of researchers has developed. The Handbook of Peer to Peer Networking is dedicated to discussions on P2P networks and their applications. This is a comprehensive book on P2P computing.

Architecting Dependable Systems V Rogério de Lemos, Felicita Giandomenico, Cristina Gacek, Henry Muccini, Marlon Vieira, 2008-08-26. As software systems become ubiquitous the issues of dependability become more and more crucial. Given that solutions to these issues must be considered from the very beginning of the design process it is reasonable that dependability is addressed at the architectural level. This book was born of an effort to bring together the research communities of software architectures and dependability. This state of the art survey contains expanded and peer reviewed papers based on the carefully selected contributions to two workshops: the Workshop on Architecting Dependable Systems WADS 2007 organized at the 2007 International Conference on Dependable Systems and Networks DSN 2007 held in Edinburgh UK in June 2007 and the Third Workshop on the Role of Software Architecture for Testing and Analysis ROSATEA 2007 organized as part of a federated conference on Component Based Software Engineering and Software Architecture CompArch 2007 held in Medford MA USA in July 2007. It also contains a number of invited papers written by recognized experts in the area. The 14 papers are organized in topical sections on critical infrastructures, rigorous design, fault tolerance and verification and validation.
