Region In Transition:

Metropolis Region Transition Beverly Duncan, Stanley Lieberman, 1970-08 *Regional Energy Transitions in Australia* Gareth A. S. Edwards, John Wiseman, Amanda Cahill, 2024-12-03 This book provides an accessible and critical appraisal of Australia's regional energy transition initiatives. The book begins by situating Australian energy transition in the context of Australian and international debates about climate change and energy transition. It then explores how energy transition planning was made possible in Australia's regional energy heartlands even while public transition planning was impossible. The authors consider five case studies of key early transition initiatives in the Latrobe Valley, Victoria, Hunter Valley, NSW, Central Queensland, Queensland, Port Augusta, South Australia, and Collie, Western Australia. They explore how transition came onto the agenda and outline the key actors, decision points, and actions. The authors critically assess the successes and failures of each initiative, drawing out key learnings for other regions. The book concludes by evaluating the key cross-cutting themes emerging from the five case studies and draws out the lessons they teach about how to achieve a just transition. This concise book will be of great interest to students and scholars of energy transitions, climate action, social justice, economic renewal, and regional transition challenges and strategies both in Australia and overseas. *Bulletin*, 1917 Public Documents of the State of Maine; Being the Reports of the Various Public Officers and Departments Maine, 1914 Smart Transitions in City Regionalism Tassilo Herrschel, Yonn Dierwechter, 2018-03-22 In recent years, smartness has risen as a buzzword to characterize novel urban policy and development patterns. As a result of this, debates around what smart actually means both theoretically and empirically have emerged within the interdisciplinary arenas of urban and regional studies. This book explores the changes in discourse, rationality, and selected responses of smartness through the theme of transition. The concept of transition provides the broader context and points of reference for adopting smartness in reconciling competing interests and agendas in city regional governance. Using case studies from around the world, including North America, Europe, and South Africa, the authors link external regime transition in societal values and goals with internal moves towards smartness. While reflecting the growing integration of overarching themes and analytical concerns, this volume further develops work on smartness, smart growth, transition, city regionalism, governance, and sustainability. *Smart Transitions in City Regionalism* explores how smart cities and city regions interact with conventional state structures. It will be of great interest to postgraduates and advanced undergraduates across urban studies, geography, sustainability studies, and political science.

Laser Heat-Mode Lithography Jingsong Wei, 2019-11-20 This book provides a systematic description and analysis of laser heat mode lithography, addressing the basic principles, lithography system manipulation of feature size, grayscale lithography, resist, thin films, and pattern transfer, while also presenting typical experimental results and applications. It introduces laser heat mode lithography where the resist thin films are essentially an opto-thermal response to the laser beam with changeable wavelength and are not sensitive to laser wavelength. Laser heat mode lithography techniques greatly

simplify production procedures because they require neither a particular light source nor a particular environment further there are no pre baking and post baking steps required for organic photoresists The pattern feature size can be either larger or smaller than the laser spot by adjusting the writing strategy The lithographic feature size can also be arbitrarily tuned from nanoscale to micrometer without changing the laser spot size Lastly the line edge roughness can be controlled at a very low value because the etching process is a process of breaking bonds among atoms The book offers an invaluable reference guide for all advanced undergraduates graduate students researchers and engineers working in the fields of nanofabrication lithography techniques and systems phase change materials etc

Pratt,2012-12-06

Suppose one were given the task of mapping the general circulation in an unfamiliar ocean. The ocean like our own is subdivided into basins and marginal seas interconnected by sea straits. Assuming a limited budget for this undertaking one would do well to choose the straits as observational starting points. To begin with the currents flowing from one basin to the next over possibly wide and time varying paths are confined to narrow and stable routes within the straits. Mass heat and chemical budgets for individual basins can be formulated in terms of the fluxes measured across the straits using a relatively small number of instruments. The confinement of the flow by a strait can also give rise to profound dynamical consequences including choking or hydraulic control a process similar to that by which a dam regulates the flow from a reservoir. The funneling geometry can lead to enhanced tidal modulation and increased velocities giving rise to local instabilities mixing internal bores jumps and other striking hydraulic and fine scale phenomena. In short sea straits represent choke points which are observationally and dynamically strategic and which contain a full range of fascinating physical processes.
