S. Manjunath, Philippe Salembier, Thomas Sikora, 2002-06-14 Introduction to MPEG 7 Ein unentbehrliches Nachschlagewerk für Elektronik und Kommunikationsingenieure die MPEG 7 kompatible Systeme entwerfen und implementieren wollen sowie für Forscher und Studenten die sich mit Multimedia Datenbanktechnologie beschäftigen Prinzipien und Konzepte der Indizierung von audiovisuellem Material Metadatenbeschreibung Informationsabfrage und Browsing sind einige der angesprochenen Themen Detailliert wird auf die wichtigsten Tools zur Indizierung und zum Abruf von Bildern und Videosequenzen eingegangen Die mitgelieferte Demo Software führt schrittweise in die Multimedia Systemkomponenten ein Introduction to Discrete Mathematics with ISETL William E. Fenton, Ed Dubinsky, 2012-12-06 Intended for first or second year undergraduates this introduction to discrete mathematics covers the usual topics of such a course but applies constructivist principles that promote indeed require active participation by the student Working with the programming language ISETL whose syntax is close to that of standard mathematical language the student constructs the concepts in her or his mind as a result of constructing them on the computer in the syntax of ISETL This dramatically different approach allows students to attempt to discover concepts in a Socratic dialog with the computer The discussion avoids the formal definition theorem approach and promotes active involvement by the reader by its questioning style An instructor using this text can expect a lively class whose students develop a deep conceptual understanding rather than simply manipulative skills Topics covered in this book include the propositional calculus operations on sets basic counting

methods predicate calculus relations graphs functions and mathematical induction

Social Networks Samuel

Leinhardt, 2013-09-17 *Social Networks* A Developing Paradigm contains studies of the nature and impact of social structure on behavior It draws together readings from a variety of social science areas that share the basic premise that structure in social relationships can be fruitfully operationalized in terms of networks It attempts to bring together classic works that opened new research areas and works that contain important statements of perspective method or empirical findings The book is organized into four parts Part I focuses on the cognitive organization of social relations and the effects of local social structure on individuals In Part II the authors consider networks of ties in large social agglomerations and treat a variety of different types of social relationships The emphasis here is on empirical studies Specific extant social networks are investigated to test a variety of structural hypotheses Part III contains studies that address issues more common among social anthropologists than sociologists or social psychologists The chapters in Part IV while occasionally containing applications are primarily methodological These discuss mathematical and statistical ideas for modeling and analyzing social networks

Introduction to Graph Neural Networks Zhiyuan Liu, Jie Zhou, 2020-03-20 This book provides a comprehensive introduction to the basic concepts models and applications of graph neural networks It starts with the introduction of the vanilla GNN model Then several variants of the vanilla model are introduced such as graph convolutional networks graph recurrent networks graph attention networks graph residual networks and several general frameworks Graphs are useful data structures in complex real life applications such as modeling physical systems learning molecular fingerprints controlling traffic networks and recommending friends in social networks However these tasks require dealing with non Euclidean graph data that contains rich relational information between elements and cannot be well handled by traditional deep learning models e g convolutional neural networks CNNs or recurrent neural networks RNNs Nodes in graphs usually contain useful feature information that cannot be well addressed in most unsupervised representation learning methods e g network embedding methods Graph neural networks GNNs are proposed to combine the feature information and the graph structure to learn better representations on graphs via feature propagation and aggregation Due to its convincing performance and high interpretability GNN has recently become a widely applied graph analysis tool Variants for different graph types and advanced training methods are also included As for the applications of GNNs the book categorizes them into structural non structural and other scenarios and then it introduces several typical models on solving these tasks Finally the closing chapters provide GNN open resources and the outlook of several future directions

Frolík, M. Katětov, V. Pták, 2014-05-12 General Topology and Its Relations to Modern Analysis and Algebra II is comprised of papers presented at the Second Symposium on General Topology and its Relations to Modern Analysis and Algebra held in Prague in September 1966 The book contains expositions and lectures that discuss various subject matters in the field of General Topology The topics considered include the algebraic structure for a topology the projection spectrum and its limit space some special methods of homeomorphism theory in infinite dimensional topology types of ultrafilters on countable sets the compactness operator in general topology and the algebraic generalization of the topological theorems of Bolzano and Weierstrass This publication will be found useful by all specialists in the field of Topology and mathematicians interested in General Topology **Graph Neural Networks: Foundations, Frontiers, and Applications** Lingfei Wu, Peng Cui, Jian Pei, Liang Zhao, 2022-01-03 Deep Learning models are at the core of artificial intelligence research today It is well known that deep learning techniques are disruptive for Euclidean data such as images or sequence data and not immediately applicable to graph structured data such as text This gap has driven a wave of research for deep learning on graphs including graph representation learning graph generation and graph classification The new neural network architectures on graph structured data graph neural networks GNNs in short have performed remarkably on these tasks demonstrated by applications in social networks bioinformatics and medical informatics Despite these successes GNNs still face many challenges ranging from the foundational methodologies to the theoretical understandings of the power of the graph representation learning This book provides a comprehensive introduction of GNNs It first discusses the goals of graph representation learning and then reviews the history current developments and future directions of GNNs The second part presents and reviews fundamental methods and theories concerning GNNs while the third part describes various frontiers that are built on the GNNs The book concludes with an overview of recent developments in a number of applications using GNNs This book is suitable for a wide audience including undergraduate and graduate students postdoctoral researchers professors and lecturers as well as industrial and government practitioners who are new to this area or who already have some basic background but want to learn more about advanced and promising techniques and applications *Selected Papers on Algebra and Topology by Garrett Birkhoff* J.S. Oliveira, G.-C. Rota, 1987-01-01 The present volume of reprints are what I consider to be my most interesting and influential papers on algebra and topology To tie them together and to place them in context I have supplemented them by a series of brief essays sketching their historical background as I see it In addition to these I have listed some subsequent papers by others which

have further developed some of my key ideas The papers on universal algebra lattice theory and general topology collected in the present volume concern ideas which have become familiar to all working mathematicians It may be helpful to make them readily accessible in one volume I have tried in the introduction to each part to state the most significant features of each paper reprinted there and to indicate later developments The background that shaped and stimulated my early work on universal algebra lattice theory and topology may be of some interest As a Harvard undergraduate in 1928-32 I was encouraged to do independent reading and to write an original thesis My tutorial reading included de la Vallée Poussin's beautiful Cours d'Analyse Infinitesimale Hausdorff's Grundzüge der Mengenlehre and Frechet's Espaces Abstraits In addition I discovered Carathéodory's 1912 paper Über das lineare Mass von Punktmengen and Hausdorff's 1919 paper on Dimension und Äusseres Mass and derived much inspiration from them A fragment of my thesis analyzing axiom systems for separable metrizable spaces was later published ² This background led to the work summarized in Part IV

[Application of Graph Rewriting to Natural Language Processing](#) Guillaume Bonfante, Bruno Guillaume, Guy Perrier, 2018-06-19 The paradigm of Graph Rewriting is used very little in the field of Natural Language Processing But graphs are a natural way of representing the deep syntax and the semantics of natural languages Deep syntax is an abstraction of syntactic dependencies towards semantics in the form of graphs and there is a compact way of representing the semantics in an underspecified logical framework also with graphs Then Graph Rewriting reconciles efficiency with linguistic readability for producing representations at some linguistic level by transformation of a neighbor level from raw text to surface syntax from surface syntax to deep syntax from deep syntax to underspecified logical semantics and conversely
