Zesta, 2005 Spina bifida SB is a neural tube defect a disorder involving incomplete development of the brain spinal cord and or their protective coverings caused by the failure of the fetus's spine to close properly during the first month of pregnancy Infants born with SB sometimes have an open lesion on their spine where significant damage to the nerves and spinal cord has occurred Although the spinal opening can be surgically repaired shortly after birth the nerve damage is permanent resulting in varying degrees of paralysis of the lower limbs Even when there is no lesion present there may be improperly formed or missing vertebrae and accompanying nerve damage In addition to physical and mobility difficulties most individuals have some form of learning disability The three most common types of SB are myelomeningocele

the severest form in which the spinal cord and its protective covering the meninges protrude from an opening in the spine meningocele in which the spinal cord develops normally but the meninges protrude from a spinal opening and occulta the mildest form in which one or more vertebrae are malformed and covered by a layer of skin SB may also cause bowel and bladder complications and many children with SB have hydrocephalus excessive accumulation of cerebrospinal fluid in the brain There is no cure for SB because the nerve tissue cannot be replaced or repaired at this time This new book brings together leading researchers in this field
