*Tribology Issues and Opportunities in MEMS* Bharat Bhushan, 2012-12-06 Micro Electro Mechanical Systems MEMS is already about a billion dollars a year industry and is growing rapidly So far major emphasis has been placed on the fabrication processes for various devices There are serious issues related to tribology mechanics surface chemistry and materials science in the operation and manufacturing of many MEMS devices and these issues are preventing an even faster commercialization Very little is understood about tribology and mechanical properties on micro to nanoscales of the materials used in the construction of MEMS devices The MEMS community needs to be exposed to the state of the art of tribology and vice versa Fundamental understanding of friction stiction wear and the role of surface contamination and environmental debris in micro devices is required There are significant adhesion friction and wear issues in manufacturing and actual use facing the MEMS industry Very little is understood about the tribology of bulk silicon and polysilicon films used in the construction of these micro devices These issues are based on surface phenomena and cannot be scaled down linearly and these become increasingly important with the small size of the devices Continuum theory breaks down in the analyses e g in fluid flow of micro scale devices Mechanical properties of polysilicon and other films are not well characterized Roughness optimization can help in tribological improvements Monolayers of lubricants and other materials need to be developed for ultra low friction and near zero wear Hard coatings and ion implantation techniques hold promise

Lifetime Estimation of Welded Joints Tadeusz

Lagoda, 2008-01-10 In the paper the author attempts to assess the fatigue life of chosen welded joints It focuses especially on

chosen problems that accompany determination of the fatigue life of welded joints taking into consideration the strain energy density parameter Chapter 2 describes the welded joint as a stress concentrator The state of stress and strain in the notch are described and theoretical and fatigue coefficients are indicated The fatigue coefficient of the notch effect is estimated on the basis of fictitious radius in the notch root Chapter 3 presents a model of fatigue life assessment under uniaxial stress state with statistical handling of data presented The new energy model of fatigue life assessment which rests upon the analysis of stress and strain in the critical plane is described in detail in chapter 4 The principle of such a description is presented in the uniaxial as well as in axial state of loading Chapter 5 contains the analysis of tests of four materials subjected to different loadings cyclic variable amplitude with Gaussian distribution and variable amplitude with Gaussian distribution and overloading for symmetric and pulsating loading The analysis is based on the determined fatigue characteristics for all the considered materials Chapter 6 shows the application of the model in the fatigue life assessment in the complex state of loading bending with torsion of flange tube and tube tube joints based on fatigue research of steel and aluminum welded joints carried out in well known German centres
