Congress. House. Committee on Appropriations. Subcommittee on Department of the Interior and Related Agencies,2002 The Metabolism of Arsenite Joanne M. Santini,Seamus A. Ward,2018-10-03 Up to 200 million people in 70 countries are at risk from drinking water contaminated with arsenic which is a major cause of chronic debilitating illnesses and fatal cancers Until recently little was known about the mobility of arsenic and how redox transformations determined its movement into or out of water supplies Although human activities contribute to the release of arsenic from minerals it is now clear that bacteria are responsible for most of the redox transformation of arsenic in the environment Bacterial oxidation of arsenite to the less mobile arsenate has been known since 1918 but it was not until 2000 that a bacterium was shown to gain energy from this process Since then a wide range of arsenite oxidizing

bacteria have been isolated including aerobes and anaerobes heterotrophs and autotrophs thermophiles mesophiles and psychrophiles This book reviews recent advances in the study of such bacteria After a section on background geology and health issues the main body of the book concerns the cellular machinery of arsenite oxidation It concludes by examining possible applications Topics treated are The geology and cycling of arsenic Arsenic and disease Arsenite oxidation physiology enzymes genes and gene regulation Community genomics and functioning and the evolution of arsenite oxidation Microbial arsenite oxidation in bioremediation Biosensors for arsenic in drinking water and industrial effluents
