Ordovas, 2010-11-10 The development of new methodologies has played a key role in the advancement of all areas of research Specifically the initial advances in our understanding of lipoprotein structure and metabolism were made possible by the development of ultracentrifugation and electrophoretic techniques More recently the advent of molecular biological techniques opened possibilities that were unthinkable just a few decades ago The use of the analytical ult centrifuge to study plasma lipoproteins began in the 1940s with the work of Mutzenbecher McFarlane Pedersen Gofman Lindgren and Elliot Another crucial step during the 1950s was the development of this tool as a prepa tive technique by Havel Eder and Bragdon among others This technolo cal progress allowed investigators to dig deeper into the structure of these complex macromolecules made of lipids and proteins and permitted inves gators to continue unraveling the physical and chemical characteristics of the proteins associated with lipoprotein particles apolipoproteins and the enzymes involved in their processing This information led to both a better understanding of the biological functions of the lipoprotein fractions and their constituents and creation of a more comprehensive overall scheme for plasma lipoprotein metabolism Several gaps in this puzzle were filled through the work of Goldstein and Brown who elucidated the structure and role of the low density lipoprotein ceptor This was the first identified among a profusion of receptors that are key for the cellular catabolism of these particles **Methods in Enzymology** John J.
