Convection in Ferro-Nanofluids: Experiments and Theory Aleksandra A. Bozhko, Sergey A. Suslov, 2018-08-25 This book covers the experimental and theoretical study of convection in non isothermal ferro nanofluids FNFs Since FNFs are not transparent and magnetic fields are very sensitive to the shape of the boundary between magnetic and nonmagnetic media special flow visualization techniques based on the use of thermo sensitive liquid crystal films infrared cameras as well as local and integral temperature sensors are discussed in the book This book considers several major configurations of convective chambers and the applied magnetic field For each of them the stability boundaries are determined theoretically and experimentally The physical types of dominant instabilities and the characteristics of their interactions are subsequently established using linear and weakly non linear hydrodynamic stability analyses and elements of bifurcation theory The book also discusses the potential of using magnetically controlled ferro nanofluids as a heat carrier in situations where heat removal by natural convection is not possible due to the lack of gravity orbital stations or extreme confinement microelectronics Researchers and practitioners working in the areas of fluid mechanics hydrodynamic stability and heat and mass transfer will benefit from this book

Thompson,A. Balogh,J.L. Culhane,Å. Nordlund,S.K. Solanki,J.-P. Zahn,2009-05-01 Starting in 1995 numerical modeling of the Earth s dynamo has ourished with remarkable success Direct numerical simulation of convection driven MHD ow in a rotating spherical shell show magnetic elds that resemble the geomagnetic eld in many respects they are dominated by the axial dipole of approximately the right strength they show spatial power spectra similar to that of Earth and the magnetic eld morphology and the temporal var tion of the eld resembles that of the geomagnetic eld Christensen and Wicht 2007 Some models show stochastic dipole reversals whose details agree with what has been inferred from paleomagnetic data Glatzmaier and Roberts 1995 Kutzner and Christensen 2002 Wicht 2005 While these models represent direct numerical simulations of the

fundamental MHD equations without parameterized induction effects they do not match actual planetary conditions in a number of respects. Specifically they rotate too slowly, are much less turbulent, and use a viscosity and thermal diffusivity that is far too large in comparison to magnetic diffusivity. Because of these discrepancies, the success of geodynamo models may seem surprising. In order to better understand the extent to which the models are applicable to planetary dynamos, scaling laws that relate basic properties of the dynamo to the fundamental control parameters play an important role. In recent years, first attempts have been made to derive such scaling laws from a set of numerical simulations that span the accessible parameter space (Christensen and Tilgner 2004; Christensen and Aubert 2006).
