Number Concepts And Relationships:

Children's Counting and Concepts of Number Karen C. Fuson, 2012-12-06 For some time now the study of cognitive development has been far and away the most active discipline within developmental psychology. Although there would be much disagreement as to the exact proportion of papers published in developmental journals that could be considered cognitive, 50% seems like a conservative estimate. Hence a series of scholarly books devoted to work in cognitive development is especially appropriate at this time. The Springer Series in Cognitive Development contains two basic types of books: namely edited collections of original chapters by several authors and original volumes written by one author or a small group of authors. The flagship for the Springer Series is a serial publication of the advances type carrying the subtitle *Progress in Cognitive Development Research*. Volumes in the Progress sequence are strongly thematic in that each is limited to some well defined domain of cognitive developmental research, e.g. logical and mathematical development, semantic development. All Progress volumes are edited collections. Editors of such books, upon consultation with the Series Editor, may elect to have their works published either as contributions to the Progress sequence or as separate volumes. All books written by one author or a small group of authors will be published as separate volumes. Within the series is being used in the selection of books for this series.

Concept Mapping as an Assessment Tool for Conceptual Understanding in Mathematics Haiyue JIN, 2022-05-05 This book investigates the practicability and effectiveness of the concept map as a tool for assessing students' conceptual understanding in mathematics. The author first introduces concept mapping and then employs it to investigate students' conceptual understanding of four different mathematical topics. Alongside traditional scoring methods, she adopts Social Network Analysis, a new technique to interpret student-constructed concept maps, which reveals fresh insights into the graphic features of the concept map and into how students connect mathematical concepts. By comparing two traditional

school tests with the concept map she examines its concurrent validity and discusses its strengths and drawbacks from the viewpoint of assessing conceptual understanding With self designed questionnaires interviews and open ended writing tasks she also investigates students and teachers attitudes toward concept mapping and describes the implications these findings may have for concept mapping s use in school and for further research on the topic Scholars and postgraduate students of mathematics education and teachers interested in concept mapping or assessing conceptual understanding in classroom settings will find this book an informative inspiring and overall valuable addition to their libraries

The Semantics of Relationships R. Green,C.A. Bean,Sung Hyon Myaeng,2013-04-18 The genesis of this volume was the participation of the editors in an ACMISIGIR Association for Computing Machinery Special Interest Group on Information Retrieval workshop entitled Beyond Word Relations Hetzler 1997 This workshop examined a number of relationship types with significance for information retrieval beyond the conventional topic matching relationship From this shared participation came the idea for an edited volume on relationships with chapters to be solicited from researchers and practitioners throughout the world Ultimately one volume became two volumes The first volume Relationships in the Organization of Knowledge Bean Green 200 I examines the role of relationships in knowledge organization theory and practice with emphasis given to thesaural relationships and integration across systems languages cultures and disciplines This second volume examines relationships in a broader array of contexts The two volumes should be seen as companions each informing the other As with the companion volume we are especially grateful to the authors who willingly accepted challenges of space and time to produce chapters that summarize extensive bodies of research The value of the volume clearly resides in the quality of the individual chapters In naming this volume The Semantics of Relationships An Interdisciplinary Perspective we wanted to highlight the fact that relationships are not just empty connectives Relationships constitute important conceptual units and make significant contributions to meaning

Medinfo Marius Fieschi, Enrico Coiera, Yu-Chan Jack Li, 2004 A fundamental challenge for medical informatics is to develop and apply better ways of understanding how information technologies and methods can help support the best care for every patient every day given available medical knowledge and resources In order to provide the most effective healthcare possible the activities of teams of health professionals have to be coordinated through well designed processes centered on the needs of patients For information systems to be accepted and used in such an environment they must balance standardization based on shared medical knowledge with the flexibility required for customization to the individual patient Developing innovative approaches to design and build evidence based careflow management systems is essential for providing the knowledge management infrastructure of health care organizations that seeks to increase performance in delivering high quality care services by efficiently exploiting available resources Parallel challenges arise in the organization of research at the biological and clinical levels where the focus on systematically organizing and supporting processes of scientific inquiry by novel informatics methods and databases are in their very early stages These Proceedings of Medinfo 2004 demonstrate the base of knowledge medical informatics professionals will collectively draw upon in the years ahead to meet these challenges and realize opportunities
