

## OPTIMAL CONTROL OF LINEARIZED COMPRESSIBLE NAVIER-STOKES EQUATIONS

SHIRSHENDU CHOWDHURY<sup>1</sup> AND MYTHILY RAMASWAMY<sup>1</sup>

**Abstract.** We study an optimal boundary control problem for the two dimensional unsteady linearized compressible Navier–Stokes equations in a rectangle. The control acts through the Dirichlet boundary condition. We first establish the existence and uniqueness of the solution for the two-dimensional unsteady linearized compressible Navier–Stokes equations in a rectangle with inhomogeneous Dirichlet boundary data, not necessarily smooth. Then, we prove the existence and uniqueness of the optimal solution over the control set. Finally we derive an optimality system from which the optimal solution can be determined.

### 1. INTRODUCTION

The Navier–Stokes equations for a viscous compressible isentropic fluid in  $\Omega \subset \mathbb{R}^N$  is

$$\left. \begin{aligned} \frac{\partial \rho}{\partial t}(t, x) + \operatorname{div}[\rho(t, x)\mathbf{v}(t, x)] &= 0, \\ \rho(t, x) \left[ \frac{\partial \mathbf{v}}{\partial t}(t, x) + (\mathbf{v}(t, x) \cdot \nabla) \mathbf{v}(t, x) \right] &= -\nabla p(t, x) + \mu \Delta \mathbf{v}(t, x) + (\lambda + \mu) \nabla [\operatorname{div} \mathbf{v}(t, x)], \\ p(t, x) &= ap^\gamma(t, x), \quad t > 0, \quad x \in \Omega, \end{aligned} \right\} \quad (1.1)$$

where  $\rho(t, x)$  is the density of the fluid,  $\mathbf{v}(t, x) = (v_1(t, x), \dots, v_N(t, x))$  denotes the velocity vector in  $\mathbb{R}^N$  and  $p(t, x)$  denotes the pressure. Note that the second equation of (1.1) componentwise is

$$\rho \left( \frac{\partial v_i}{\partial t} + \mathbf{v} \cdot \nabla v_i \right) = -\frac{\partial p}{\partial x_i} + \mu \Delta v_i + (\lambda + \mu) \frac{\partial}{\partial x_i} [\operatorname{div} \mathbf{v}], i = 1, 2, \dots, N.$$

Throughout this paper, we follow this same notational convention and use bold script to denote vectors and product spaces. The viscosity coefficients  $\mu, \lambda$  are assumed to be constant satisfying the following thermodynamic restrictions:  $\mu > 0$ ,  $\lambda + \mu \geq 0$  and the constants  $a > 0$ ,  $\gamma > 1$ .

*Keywords and phrases.* Optimal control, linearized compressible Navier–Stokes equations, boundary control, optimality system.

### **Projection and Quasi-Compressibility Methods for Solving the Incompressible Navier-Stokes Equations**

,2013-11-11 Projection methods had been introduced in the late sixties by A Chorin and R Teman to decouple the computation of velocity and pressure within the time stepping for solving the nonstationary Navier Stokes equations Despite the good performance of projection methods in practical computations their success remained somewhat mysterious as the operator splitting implicitly introduces a nonphysical boundary condition for the pressure The objectives of this monograph are twofold First a rigorous error analysis is presented for existing projection methods by means of relating them to so called quasi compressibility methods e g penalty method pressure stabilization method etc This approach highlights the intrinsic error mechanisms of these schemes and explains the reasons for their limitations Then in the second part more sophisticated new schemes are constructed and analyzed which are exempted from most of the deficiencies of the classical projection and quasi compressibility methods this book should be mandatory reading for applied mathematicians specializing in computational fluid dynamics J L Guermond Mathematical Reviews Ann Arbor
