Representability Of Stochastic Systems:

Representability of Stochastic Systems György Michaletzky, J. Bokor, P. Várlaki, 1998 The purpose of this book is to investigate modeling and representational approaches of stationary stochastic phenomena Detailed structure of the state space realizations is provided using geometric Hilbert space principles including the analysis of the zero structure and balanced realizations The structure of generalized Wiener Hopf factorization is studied in details first using geometric consideration then computing the system matrices This text's perspective will be of interest to those doing research in signal processing stochastic modeling and system identification or in control system design Parts of the texts can also be useful in courses on stochastic systems filtering prediction or on realization theory *Linear Stochastic Systems* Anders Lindquist, Giorgio Picci, 2015-04-24 This book presents a treatise on the theory and modeling of second order stationary processes including an exposition on selected application areas that are important in the engineering and applied sciences The foundational issues regarding stationary processes dealt with in the beginning of the book have a long history starting in the 1940s with the work of Kolmogorov Wiener Cramér and his students in particular Wold and have since been refined and complemented by many others Problems concerning the filtering and modeling of stationary random signals and systems have also been addressed and studied fostered by the advent of modern digital computers since the fundamental work of R E Kalman in the early 1960s The book offers a unified and logically consistent view of the subject based on simple ideas from Hilbert space geometry and coordinate free thinking In this framework the concepts of stochastic state space and state space modeling based on the notion of the conditional independence of past and future flows of the relevant signals are revealed to be fundamentally unifying ideas The book based on over 30 years of original research represents a valuable contribution that will inform the fields of stochastic modeling estimation system identification and time series analysis for decades to come It also provides the mathematical tools needed to grasp and analyze the structures of algorithms in stochastic systems theory

Geometrical Methods for the Theory of Linear Systems C.I. Byrnes, C.F. Martin, 2012-12-06 The lectures contained in this book were presented at Harvard University in June 1979 The workshop at which they were presented was the third such on algebraic geometric methods The first was held in 1973 in London and the emphasis was largely on geometric methods The second was held at Ames Research Center NASA in 1976 There again the emphasis was on geometric methods but algebraic geometry was becoming a dominant theme In the two years after the Ames meeting there was tremendous growth in the applications of algebraic geometry to systems theory and it was becoming clear that much of the algebraic systems theory was very closely related to the geometric systems theory On this basis we felt that this was the right time to devote a workshop to the applications of algebra and algebraic geometry to linear systems theory The lectures contained in this volume represent all but one of the tutorial lectures presented at the workshop The lecture of Professor Murray Wonham is not contained in this volume and we refer the interested to the archival literature This workshop was jointly sponsored by a

grant from Ames Research Center NASA and a grant from the Advanced Study Institute Program of NATO We greatly appreciate the financial support rendered by these two organizations The American Mathematical Society hosted this meeting as part of their Summer Seminars in Applied Mathematics and will publish the companion volume of contributed papers

Multidimensional Stationary Time Series Marianna Bolla,Tamás Szabados,2021-04-29 This book gives a brief survey of the theory of multidimensional multivariate weakly stationary time series with emphasis on dimension reduction and prediction Understanding the covered material requires a certain mathematical maturity a degree of knowledge in probability theory linear algebra and also in real complex and functional analysis For this the cited literature and the Appendix contain all necessary material The main tools of the book include harmonic analysis some abstract algebra and state space methods linear time invariant filters factorization of rational spectral densities and methods that reduce the rank of the spectral density matrix Serves to find analogies between classical results Cramer Wold Kolmogorov Wiener K lm n Rozanov and up to date methods for dimension reduction in multidimensional time series Provides a unified treatment for time and frequency domain inferences by using machinery of complex and harmonic analysis spectral and Smith McMillan decompositions Establishes analogies between the time and frequency domain notions and calculations Discusses the Wold s decomposition and the Kolmogorov s classification together by distinguishing between different types of singularities Understanding the remote past helps us to characterize the ideal situation where there is a regular part at present Examples and constructions are also given Establishes a common outline structure for the state space models prediction and innovation algorithms with unified notions and principles which is applicable to real life high frequency time series It is an ideal companion for graduate students studying the theory of multivariate time series and researchers working in this field

Modularity in Motor Control: From Muscle Synergies to Cognitive Action Representation Andrea d'Avella,Martin Giese,Yuri P Ivanenko,Thomas Schack,Tamar Flash,2016-04-21 Mastering a rich repertoire of motor behaviors as humans and other animals do is a surprising and still poorly understood outcome of evolution development and learning Many degrees of freedom non linear dynamics and sensory delays provide formidable challenges for controlling even simple actions Modularity as a functional element both structural and computational of a control architecture might be the key organizational principle that the central nervous system employs for achieving versatility and adaptability in motor control Recent investigations of muscle synergies motor primitives compositionality basic action concepts and related work in machine learning have contributed to advance at different levels our understanding of the modular architecture underlying rich motor behaviors However the existence and nature of the modules in the control architecture is far from settled For instance regularity and low dimensionality in the motor output are often taken as an indication of modularity but could they simply be a byproduct of optimization and task constraints Moreover what are the relationships between modules at different levels such as muscle synergies kinematic invariants and basic action concepts One important reason for the new interest in

understanding modularity in motor control from different viewpoints is the impressive development in cognitive robotics. In comparison to animals and humans the motor skills of today's best robots are limited and inflexible. However, robot technology is maturing to the point at which it can start approximating a reasonable spectrum of isolated perceptual, cognitive and motor capabilities. These advances allow researchers to explore how these motor, sensory and cognitive functions might be integrated into meaningful architectures and to test their functional limits. Such systems provide a new test bed to explore different concepts of modularity and to address the interaction between motor and cognitive processes experimentally. Thus the goal of this Research Topic is to review, compare and debate theoretical and experimental investigations of the modular organization of the motor control system at different levels. By bringing together researchers seeking to understand the building blocks for coordinating many muscles for planning endpoint and joint trajectories and for representing motor and behavioral actions in memory, we aim at promoting new interactions between often disconnected research areas and approaches and at providing a broad perspective on the idea of modularity in motor control. We welcome original research, methodological, theoretical review and perspective contributions from behavioral, system and computational motor neuroscience, research, cognitive psychology and cognitive robotics.

Towards Intelligent Engineering and Information Technology Imre J. Rudaš, János Fodor, Janusz Kacprzyk, 2009-08-18. This book presents the state of the art of computational intelligence in engineering. It offers challenging problems for efficient modeling of intelligent systems and details different methodologies of computational intelligence with real life applications.

Vector products and Applications J. Szép, 1998. With the present abundance of mathematical journals and publications of mathematical research centers it is becoming increasingly difficult to keep up to date even in special fields. For this reason Akadémiai Kiadó are launching a new mathematical series of which Vector products and Applications is the first volume. The fundamental concepts dealt with in this initial volume are the structure of parentheses and the p multiplications of vectors. In the latter case the product of the two vectors is again a vector and the structure for a given p is a semigroup.

Low-Rank Approximation Ivan Markovsky, 2018-08-03. This book is a comprehensive exposition of the theory, algorithms and applications of structured low rank approximation. Local optimization methods and effective suboptimal convex relaxations for Toeplitz, Hankel and Sylvester structured problems are presented. A major part of the text is devoted to application of the theory with a range of applications from systems and control theory to psychometrics being described. Special knowledge of the application fields is not required. The second edition of Low Rank Approximation is a thoroughly edited and extensively rewritten revision. It contains new chapters and sections that introduce the topics of variable projection for structured low rank approximation, missing data estimation, data driven filtering and control, stochastic model representation and identification, identification of polynomial time invariant systems and blind identification with deterministic input model. The book is complemented by a software implementation of the methods presented which makes the theory directly applicable in practice. In particular all

numerical examples in the book are included in demonstration files and can be reproduced by the reader This gives hands on experience with the theory and methods detailed In addition exercises and MATLAB Octave examples will assist the reader quickly to assimilate the theory on a chapter by chapter basis Each chapter is completed with a new section of exercises to which complete solutions are provided Low Rank Approximation second edition is a broad survey of the Low Rank Approximation theory and applications of its field which will be of direct interest to researchers in system identification control and systems theory numerical linear algebra and optimization The supplementary problems and solutions render it suitable for use in teaching graduate courses in those subjects as well

Statistical Physics for Cosmic Structures Andrea Gabrielli, F. Sylos Labini, Michael Joyce, Luciano Pietronero, 2006-02-23 This book has its roots in a series of collaborations in the last decade at the interface between statistical physics and cosmology The specific problem which initiated this research was the study of the clustering properties of galaxies as revealed by large redshift surveys a context in which concepts of modern statistical physics e g scale invariance fractality and ready application In recent years we have considerably broadened the range of problems in cosmology which we have addressed treating in particular more theoretical issues about the statistical properties of standard cosmological models What is common to all this research however is that it is informed by a perspective and methodology which is that of statistical physics We can say that beyond its specific scientific content this book has an underlying thesis such interdisciplinary research is an exciting playground for statistical physics and one which can bring new and useful insights into cosmology The book does not represent a final point but in our view a marker in the development of this kind of research which we believe can go very much further in the future Indeed as we complete this book new developments which unfortunately we have not been able to include here have been made on some of the themes described here Our focus in this book is on the problem of structure in cosmology

Mathematical System Theory Athanasios C. Antoulas, 2013-04-17 Over the past three decades R E Kalman has been one of the most influential personalities in system and control theory His ideas have been instrumental in a variety of areas This is a Festschrift honoring his 60th birthday It contains contributions from leading researchers in the field giving an account of the profound influence of his ideas in a number of areas of active research in system and control theory For example since their introduction by Kalman in the early 60 s the concepts of controllability and observability of dynamical systems with inputs have been the corner stone of the great majority of investigations in the field
