

Human Reproduction

Human reproduction

Human reproduction is sexual reproduction involving male and female reproductive cells called gametes. The reproductive system includes organs called gonads that produce gametes and hormones; ducts for transport, storage and composition of gametes; accessory organs and glands for fluid secretion; and internal genitalia. Reproduction is regulated by hormones produced by the gonads, the hypothalamus and the pituitary gland. Fertilisation involves the introduction of sperm into the vagina. The sperm travels through the female reproductive tract until it encounters an ovum, a female sex gamete. Fertilisation can then take place.

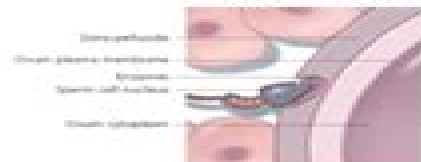

Male reproductive system

The adult male reproductive system is a complex of two primary external structures, the testes and the penis. The testes are divided into thousands of tiny compartments or lobules containing seminiferous tubules, tightly coiled structures where sperm formation takes place.

The testes are situated in a temperature-cooler environment called the scrotum, which provides support and regulates the position of the testes relative to the body. The scrotum contracts because of the nervous system to change its external temperature to maintain the proper temperature within the testes for sperm formation.

Seminiferous tubules produce sperm cells, which are transported into the epididymis, a structure located in the scrotum responsible for maturing the sperm and directing it to the vas deferens and penile urethra, and providing the development of male secondary sex characteristics.

Fertilization

The upper portion of the vagina leads to the vaginal canal for fertilisation. Millions of sperm travel through the female reproductive tract, utilizing coiled ducts called fallopian tubes. When a sperm enters the female reproductive tract, it passes through the cervix, the entrance of the uterus, following menstruation. If the sperm travels through a path made by the digestive action of the uterus, it will reach the fallopian tube, where it can meet an egg. The fallopian tube is a muscular tube, and the sperm nucleus and associated material enter into the egg. Other sperm are prevented from entering by a chemical change in the zona pellucida.

The egg nuclear membrane dissolves the chromosomes of the egg and sperm combine, and a fertilized egg, or zygote, is formed. The change process starts with a nuclear division, producing 2 identical cells called blastomeres.

Female reproductive system

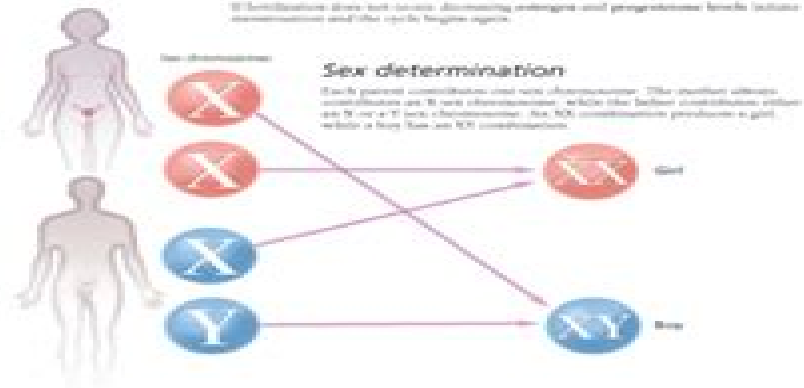

The internal structure of the adult female reproductive system includes the vagina, uterus, ovaries and oviducts. These structures form a pathway allowing the release of an egg cell, fertilisation, its growth and delivery of a developed fetus. The vagina is a muscular canal that receives the penis and provides a passage for sperm and menstrual discharge. The uterus is a hollow pear-shaped organ with muscular walls that contract during childbirth. The lower lining of the uterus is the endometrium, which sheds during each menstrual cycle in preparation for implantation by a fertilized egg. This lining is shed during menstruation if fertilisation does not occur.

The ovaries, located on each side of the uterus, are responsible for producing ova as well as the female sex hormones estrogen and progesterone. Estrogens are responsible for the development of the female reproductive structures, sexual characteristics, and breast development. Progesterone prepares the uterus lining for implantation of a fertilized egg and is necessary for breast milk production. The ovaries are connected to the uterus by the ovarian tubes, narrow ducts that provide a passageway for the egg to reach the uterus.

Ovulation & the menstrual cycle

The menstrual cycle refers to the sequence of events that occurs in the endometrium, the cell lining lining the uterus. The cycle normally lasts approximately 28 days. The purpose is to prepare the uterus for possible pregnancy. The menstrual cycle is governed by the endocrine system. If fertilisation does not occur, decreasing estrogen and progesterone levels initiate menstruation and the cycle begins again.
