Annals of the Carnegie Museum ,1913 Approaches in Bioremediation Ram Prasad,Elisabet Aranda,2018-12-08

Bioremediation refers to the clean up of pollution in soil groundwater surface water and air using typically microbiological processes It uses naturally occurring bacteria and fungi or plants to degrade transform or detoxify hazardous substances to human health or the environment For bioremediation to be effective microorganisms must enzymatically attack the pollutants and convert them to harmless products As bioremediation can be effective only where environmental conditions permit microbial growth and action its application often involves the management of ecological factors to allow microbial growth and degradation to continue at a faster rate Like other technologies bioremediation has its limitations Some contaminants such as chlorinated organic or high aromatic hydrocarbons are resistant to microbial attack They are degraded either gradually or not at all hence it is not easy to envisage the rates of clean up for bioremediation implementation Bioremediation represents a field of great expansion due to the important development of new technologies Among them several decades on metagenomics expansion has led to the detection of autochthonous microbiota that plays a key role

during transformation Transcriptomic guides us to know the expression of key genes and proteomics allow the characterization of proteins that conduct specific reactions In this book we show specific technologies applied in bioremediation of main interest for research in the field with special attention on fungi which have been poorly studied microorganisms Finally new approaches in the field such as CRISPR CAS9 are also discussed Lastly it introduces management strategies such as bioremediation application for managing affected environment and bioremediation approaches Examples of successful bioremediation applications are illustrated in radionuclide entrapment and retardation soil stabilization and remediation of polycyclic aromatic hydrocarbons phenols plastics or fluorinated compounds Other emerging bioremediation methods include electro bioremediation microbe availed phytoremediation genetic recombinant technologies in enhancing plants in accumulation of inorganic metals and metalloids as well as degradation of organic pollutants protein metabolic engineering to increase bioremediation efficiency including nanotechnology applications are also discussed

Territorial Heritage and Development José Maria Feria, 2012-03-05 This book presents a new approach to heritage linking it to territory and sustainable development This new approach entails a broader integrated view of heritage values on the one hand and on the other a shift in emphasis from their protection to their valorisation In short it provides a view of the joint workings of natural and cultural resources and as a consequence moving away from a protection point of view in favour of a perspective on their suitable sustainable valorisation In the viewpoint taken here sustainability is understood as the balance and long term preservation and enhancement of such natural and cultural resources and processes in a given territory Territorial Heritage and Development includes contributions from different disciplines geography architecture planning sociology environmental studies and archaeology and case studies drawn from three continents broaching both analytical and conceptual developments and a range of initiatives for engaging in territorial heritage as an instrument of sustainable development The book takes a pioneering and relevant approach to the breadth and complexity of the issue which can be valuable to academics and policy makers in Geography Architecture Planning and Sociology

Inca Rituals and Sacred Mountains Maria Constanza Ceruti,Johan Reinhard,2010-12-31 The Incas carried out some of the most dramatic ceremonies known to us from ancient times Groups of people walked hundreds of miles across arid and mountainous terrain to perform them on mountains over 6 096 m 20 000 feet high The most important offerings made during these pilgrimages involved human sacrifices capacochas Although Spanish chroniclers wrote about these offerings and the state sponsored processions of which they were a part their accounts were based on second hand sources and the only direct evidence we have of the capacocha sacrifices comes to us from archaeological excavations Some of the most thoroughly documented of these were undertaken on high mountain summits where the material evidence has been exceptionally well preserved In this study we describe the results of research undertaken on Mount Llullaillaco 6 739 m 22 109 feet which has the world s highest archaeological site The types of ruins and artifact assemblages recovered are described and analyzed By comparing the archaeological evidence with the chroniclers accounts and with findings from other mountaintop sites common patterns are demonstrated while at the same time previously little known elements contribute to our understanding of key aspects of Inca religion This study illustrates the importance of archaeological sites being placed within the broader context of physical and sacred features of the natural landscape
