### **On the Maintenance Modeling and Optimization of Repairable Systems**

Suzan Alaswad,2012 The use of mathematical modeling for the purpose of analyzing and optimizing the performance of repairable systems is widely studied in the literature In this dissertation we study two different scenarios on the maintenance modeling and optimization of repairable systems First we study the long run availability of a traditional repairable system that is subjected to imperfect corrective maintenance We use Kijima s second virtual age model to describe the imperfect repair process Because of the complexity of the underlying probability models we use simulation modeling to estimate availability performance and meta modeling to convert the reliability and maintainability parameters of the repairable system into an availability estimate without the simulation effort As a last step we add age based perfect preventive maintenance to our analysis Second we optimize a preventive maintenance policy for a two component repairable system When either component fails instantaneous minimal and costly corrective maintenance is performed on the component At equally spaced discrete points during the system s useful life the decision maker has the option to perform instantaneous imperfect and costly preventive maintenance on one or both of the components to instantaneously replace one or both of the components or to do nothing We use a Genetic Algorithm in an attempt to find a cost optimal set of preventive maintenance and replacement decisions

Dekker** Christophe Gouin,2011-05-18 Scientific Essay from the year 2011 in the subject Business economics Business Management Corporate Governance grade 19 5 20 University of Rennes 1 language English abstract Maintenance management and optimization of maintenance is getting more and more important for a large number of companies The use of automated machines and equip ment in order to produce goods is very common today hence companies have to rely on reliable machines which are available and working 100% of the time In order to attain a flawless working factory maintenance management is crucial However companies cannot hope that the decisions they make

concerning maintenance management are optimal and they start therefore to use decision support systems based on optimization methods Also maintenance management is very complex and a lot of different decisions have to be made like defining maintenance intervals personal planning when to buy spare parts when to replace equipment etc It is easier for companies to base their decisions on a mathematical program and therefore the use of maintenance management optimization models arises Optimization models proved to be very advantageous in other sectors so it was just a matter of time before optimization methods were ported to maintenance management Problematic in the case of maintenance optimization are the very specific maintenance problems resulting in a large number of different maintenance optimization models It is consequently very difficult to get a good overview about the different models and their application R Dekker who has worked a lot on maintenance optimization and on operations research in maintenance management wrote a paper about maintenance optimization methods and their application Application of maintenance optimization models a review and analysis It summarizes maintenance management in general gives a brief history of maintenance management describes different optimization methods their practical application problems which can occur by applying the models etc In this paper I will discuss the work of R Dekker first of all there will be a description of the paper explaining what it is about and giving a resume of important aspects In the second section the paper will be compared to other papers concerning maintenance optimization different and identical aspects will be explained Furthermore some information will be added in order to simplify the comprehension of maintenance optimization models Finally I will comment the paper and give my opinion about the aspects that I liked and what I would describe differently

Multicriteria and Optimization Models for Risk, Reliability, and Maintenance Decision Analysis Adiel Teixeira de Almeida, Love Ekenberg, Philip Scarf, Enrico Zio, Ming J. Zuo, 2022-06-28 This book considers a broad range of areas from decision making methods applied in the contexts of Risk, Reliability, and Maintenance RRM. Intended primarily as an update of the 2015 book Multicriteria and Multiobjective Models for Risk, Reliability, and Maintenance Decision Analysis, this edited work provides an integration of applied probability and decision making. Within applied probability it primarily includes decision analysis and reliability theory amongst other topics closely related to risk analysis and maintenance. In decision making it includes multicriteria decision making, aiding MCDM, A methods, and optimization models. Within MCDM, in addition to decision analysis, some of the topics related to mathematical programming areas are considered such as multiobjective linear programming, multiobjective nonlinear programming, game theory, and negotiations, and multiobjective optimization. Methods related to these topics have been applied to the context of RRM. In MCDA, several other methods are considered such as outranking methods, rough sets, and constructive approaches. The book addresses an innovative treatment of decision making in RRM, improving the integration of fundamental concepts from both areas of RRM and decision making. This is accomplished by presenting current research developments in decision making on RRM. Some pitfalls of decision models on practical applications on RRM are discussed, and new approaches for overcoming those drawbacks are presented.

*Maintenance models for systems subject to measurable deterioration* Robin Pieter Nicolai, 2008 Complex engineering systems such as bridges, roads, flood defence structures, and power pylons play an important role in our society. Unfortunately, such systems are subject to deterioration, meaning that in course of time their

condition falls from higher to lower and possibly even to unacceptable levels Maintenance actions such as inspection local repair and replacement should be done to retain such systems in or restore them to acceptable operating conditions After all the economic consequences of malfunctioning infrastructure systems can be huge In the life cycle management of engineering systems the decisions regarding the timing and the type of maintenance depend on the temporal uncertainty associated with the deterioration Hence it is of importance to model this uncertainty In the literature deterioration models based on Brownian motion and gamma process have had much attention but a thorough comparison of these models lacks In this thesis both models are compared on several aspects both in a theoretical as well as in an empirical setting Moreover they are compared with physical process models which can capture structural insights into the underlying process For the latter a new framework is developed to draw inference Next models for imperfect maintenance are investigated Finally a review is given for systems consisting of multiple components
