Kleeman, 2017-12 Excerpt from A Kinetic Theory of Gases and Liquids In constructing a general Kinetic Theory the problem that presents itself first for investigation is the dependence of the velocity of translation of a molecule in a substance on its density and temperature It is often assumed that this velocity is the same in the liquid as in the gaseous state at the same

temperature It can be shown however that this holds only for each molecule at the instant it passes through a point in the substance at which the forces of the surrounding molecules neutralize each other The total average velocity corresponding to the whole path of a molecule is usually much greater than the foregoing velocity in a liquid and dense gas on account of the effect of the molecular forces of attraction and repulsion About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at www.forgottenbooks.com This book is a reproduction of an important historical work Forgotten Books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy In rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition We do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

GASEOUS VISCOSITY AND THE TEMPERATURE 127 illustrated by the following considerations A molecule transfers a certain amount of momentum to the gas at the end of each transfer distance on migrating at right angles to the motion of the gas in the direction of the decrease of motion If the concentration of the gas is halved the length of each transfer distance is doubled while the momentum transferred at the end of each transfer distance is also doubled since the velocity gradient of the gas remains the same Since a change in molecular concentration of a gas does not alter the molecular velocities the momentum transferred per second by a molecule moving between two parallel plates of material one of which is at rest while the other moves parallel to itself is in the latter case double that in the former But since the number of molecules per cubic cm available for momentum transference in the former case is half the number in the latter the total momentum transferred is in each case the same or the viscosity of the gas has not been altered by altering its density The quantity K is a function of the temperature This is shown by the calculated values of K contained in Table X for a number of gases at different temperatures These values are not corrected for

Molecular Theory of Nematic (and Other) Liquid Crystals Paul van der Schoot, 2022-07-29 This book provides a didactic derivation of the main theories of thermotropic and lyotropic liquid crystals revealing the common molecular theoretic framework that underpins both theories This unified context will help young

researchers in coming to grips with the basics of the simplest of liquid crystals being uniaxial nematic liquid crystals easing them into the intricacies of more complex forms of such materials irrespective of whether they are thermotropic or lyotropic The coverage provides a theoretical understanding of the phase behaviour that is what drives molecules and particles to spontaneously align themselves as well as an appreciation of the role of entropy energy and so on The focus here is on the main theories for the isotropic nematic transition being the Maier Saupe and the Onsager theories and how they are derived from a common description known as classical density functional theory DFT This book will be a valuable resource for senior undergraduate and graduate students and experimentalists and engineers who feel intimidated by more formal or rigorous theoretical accounts and textbooks Exercises at the end of each chapter help the reader to apply the basic concepts also to other types of liquid crystal in particular the smectic liquid crystal

Physical Chemistry for the Biosciences Raymond Chang, 2005-02-11 This book is ideal for use in a one semester introductory course in physical chemistry for students of life sciences The author's aim is to emphasize the understanding of physical concepts rather than focus on precise mathematical development or on actual experimental details Subsequently only basic skills of differential and integral calculus are required for understanding the equations The end of chapter problems have both physiochemical and biological applications
