Some articles explored the roles played by different lipid mediators generated from arachidonic acid including leukotrienes and prostanoids such as prostacyclin and prostaglandin PG F_{2a} in inflammatory conditions. Moreover, the protectin PD family of specialized pro-resolving mediators biosynthesized from the two omega-3 polyunsaturated fatty acids docosahexaenoic acid (DHA) and n-3 docosapentaenoic acid (DPA) were described for their biological effects. The G-coupled protein receptors pharmacology, biosynthesis, and medicinal chemistry. Some other articles focused on the development of novel strategies to counteract inflammation or to induce its resolution. The current concepts and controversies on classification, pathogenesis, and clinical management of cutaneous adverse events induced by biologic agents used in the treatment of rheumatologic conditions were discussed in another article. The whole exome and whole genome sequencing data identifying new and old loci associated with atherosclerosis will lead to discovering new molecular targets for blocking atherosclerosis even in its early stages. This critical issue was reviewed in another paper. Numerous information on an individual clinical condition is held in their platelet-derived microparticles (MPs); the assessment of their number and size together with their content can represent the signature to acquire diagnostic information and to monitor the efficacy of therapeutic agents. Some other articles discussed the role of fibroblasts in the development of fibrosis and potential therapies under investigation. It was enlightened the role of the activation and transdifferentiation of hepatic stellate cells (HSCs) into contractile matrix-producing myofibroblasts (MFBs) as central events in hepatic fibrogenesis and summarized the current strategies for targeted delivery of drugs to pro-fibrogenic liver cells including the development of therapeutics specifically targeting HSCs.
