

Binary Operators as Member Functions

- An operator may be defined as a member function of a class.
- That may or may not be a good idea.
- A binary operator is invoked by the **left** operand of the expression.
- Thus, the expression $a + b$ is interpreted as $a.\text{operator}+(b)$

Trotter-Kato Product Formulæ Valentin A. Zagrebnov, Hagen Neidhardt, Takashi Ichinose, 2024-06-11 The book captures a fascinating snapshot of the current state of results about the operator norm convergent Trotter Kato Product Formulæ on Hilbert and Banach spaces. It also includes results on the operator norm convergent product formulæ for solution operators of the non autonomous Cauchy problems as well as similar results on the unitary and Zeno product formulæ. After the Sophus Lie product formula for matrices was established in 1875 it was generalised to Hilbert and Banach spaces for convergence in the strong operator topology by H Trotter 1959 and then in an extended form by T Kato 1978. In 1993 Dzh L Rogava discovered that convergence of the Trotter product formula takes place in the operator norm topology. The latter is the main subject of this book which is dedicated essentially to the operator norm convergent Trotter Kato Product Formulæ on Hilbert and Banach spaces but also to related results on the time dependent unitary and Zeno product formulæ. The book yields a detailed up to date introduction into the subject that will appeal to any reader with a basic knowledge of functional analysis and operator theory. It also provides references to the rich literature and historical remarks.

Degenerate Differential Equations in Banach Spaces Angelo Favini, Atsushi Yagi, 1998-09-10 This work presents a detailed study of linear abstract degenerate differential equations using both the semigroups generated by multivalued linear operators and extensions of the operational method from Da Prato and Grisvard. The authors describe the recent and original results on PDEs and algebraic differential equations and establishes the analyzability of the semigroup generated by some degenerate parabolic operators in spaces of continuous functions.

Photons In Fock Space And Beyond (In 3 Volumes) Reinhard Honegger, Alfred Rieckers, 2015-04-22 The three volume major reference *Photons in Fock Space and Beyond* undertakes a new mathematical and conceptual foundation of the theory of light emphasizing mesoscopic radiation systems. The quantum optical notions are generalized beyond Fock representations where the richness of an infinite dimensional quantum field system with its mathematical difficulties and theoretical possibilities is fully taken into account. It aims at a microscopic formulation of a mesoscopic model class which covers in principle all stages of the generation and propagation of light within a unified and well defined conceptual frame. The dynamics of the interacting systems is founded according to original works of the authors on convergent perturbation series and describes the developments of the quantized microscopic as well as the classical collective degrees of freedom at the same time. The achieved theoretical unification fits especially to laser and microwave applications inheriting objective information over quantum noise. A special advancement is the incorporation of arbitrary multiply connected cavities where ideal conductor

boundary conditions are imposed From there arises a new category of classical and quantized field parts apparently not treated in Quantum Electrodynamics before In combination with gauge theory the additional cohomological fields explain topological quantum effects in superconductivity Further applications are to be expected for optoelectronic and optomechanical systems

Spectral Geometry of Partial Differential Operators Michael Ruzhansky, Makhmud Sadybekov, Durvudkhan Suragan, 2020-02-07 The aim of Spectral Geometry of Partial Differential Operators is to provide a basic and self contained introduction to the ideas underpinning spectral geometric inequalities arising in the theory of partial differential equations Historically one of the first inequalities of the spectral geometry was the minimization problem of the first eigenvalue of the Dirichlet Laplacian Nowadays this type of inequalities of spectral geometry have expanded to many other cases with number of applications in physics and other sciences The main reason why the results are useful beyond the intrinsic interest of geometric extremum problems is that they produce a priori bounds for spectral invariants of partial differential operators on arbitrary domains Features Collects the ideas underpinning the inequalities of the spectral geometry in both self adjoint and non self adjoint operator theory in a way accessible by anyone with a basic level of understanding of linear differential operators Aimed at theoretical as well as applied mathematicians from a wide range of scientific fields including acoustics astronomy MEMS and other physical sciences Provides a step by step guide to the techniques of non self adjoint partial differential operators and for the applications of such methods Provides a self contained coverage of the traditional and modern theories of linear partial differential operators and does not require a previous background in operator theory

The Commutant Lifting Approach to Interpolation Problems

Foias, Frazho, 2013-11-11 Classical H interpolation theory was conceived at the beginning of the century by C Caratheodory L Fejer and I Schur The basic method due to Schur in solving these problems consists in applying the Mobius transform to peel off the data In 1967 D Sarason encompassed these classical interpolation problems in a representation theorem of operators commuting with special contractions Shortly after that in 1968 B Sz Nagy and C Foias obtained a purely geometrical extension of Sarason's results Actually their result states that operators intertwining restrictions of co isometries can be extended by preserving their norm to operators intertwining these co isometries starring with R G Douglas P S Muhly and C Pearcy this is referred to as the commutant lifting theorem In 1957 Z Nehari considered an L interpolation problem which in turn encompassed the same classical interpolation problems as well as the computation of the distance of a function f in L to H At about the sametime as Sarason's work V M

Regular Extensions of Hermitian Operators A. V. Kuzhel, S. a. Kuzhel, 1998-01-01 The concept of regular extensions of an Hermitian non densely defined operator was introduced by A Kuzhel in 1980 This concept is a natural generalization of proper extensions of symmetric densely defined operators The use of regular extensions enables one to study various classes of extensions of Hermitian operators without using the method of linear relations The central question in this monograph is to what extent the Hermitian part of a linear operator determines its properties Various properties are investigated and some applications of the theory are given Chapter 1 deals with some results from operator theory and the theory of extensions Chapter 2 is devoted to the investigation of regular extensions of Hermitian symmetric operators with certain restrictions In chapter 3 regular extensions of Hermitian operators with the use of boundary value spaces are investigated In the final chapter the results from chapters 1 3 are applied to the investigation of quasi differential operators and models of zero range potential with internal structure
