Description

The field of atmospheric radiation and remote sensing has seen significant advances in recent years. This monograph addresses those advances and fills the need for an up-to-date, cohesive integration of radiative transfer and cloud physics, allowing for the better forecast of weather on medium and long-range levels. The author here offers a systematic discussion of the transfer of solar and thermal infrared radiation in the atmosphere, and of aspects of cloud processes pertinent to radiative transfer. The book focuses largely on the physical principles and approximations that are required to develop important topics in atmospheric radiation, cloud physics, and thermal equilibrium. Aspects of the interactions and feedbacks of radiation-cloud and dynamic and climate processes are discussed using a hierarchy of atmospheric models. Radiometric data obtained from the ground, the air, and space are frequently employed to illustrate physical processes in the atmosphere as well as to cross check theoretical results. The author also cogently discusses the application of the radiative transfer principle to remote sensing of atmospheric and cloud parameters. This book for the first time bridges the gap between cloud-radiation and dynamic processes in the atmosphere. It will be welcomed by meteorologists, earth scientists, and researchers interested in atmospheric modeling and radiation.

The Stratosphere and Its Role in the Climate System Guy P. Brasseur, 2013-06-29 This book presents a summary of the lectures given at the NATO Advanced Science Institute ASI which took place at Val Morin Quebec Canada 4-15 September 1995 This summer school offered an excellent opportunity to discuss key scientific questions related to the stratosphere and its importance for the climate system Approximately 85 students and 15 lecturers from 19 nations attended the ASI which was sponsored by SPARC Stratospheric Processes and Their Role in Climate a project of the World Climate Research Programme The purpose of the ASI was to present truly tutorial lectures rather than highly specialized or technical talks At the conference mornings were devoted to fundamental presentations while short illustrative talks were given in the afternoon The book presents a summary of the two types of lectures We were fortunate to enlist the participation of outstanding experts in the field of atmospheric science and excellent teachers Students were strongly encouraged to actively participate in various activities during the summer school for example the students were asked to summarize the lectures given by the teachers and in most cases the chapters presented in this book were written by small groups of students and reviewed by the lecturers During the school students had also the opportunity to present posters that described their personal research These lecture notes are divided into three major parts
