Radiofrequency Catheter Ablation For The Treatment Of Cardiac Arrhythmias:

Radiofrequency Catheter Ablation for Cardiac Arrhythmias, 2002 Catheter ablation is a treatment for patients with heart rhythm disturbances cardiac arrhythmias called tachycardias Tachycardias cause symptoms that degrade the quality of life of individuals and are a life long medical problem Some of them are common medical problems such as atrial fibrillation and many begin at a young age with the potential for life long morbidity Certain tachycardias can be life threatening Drug therapy to control these tachycardias is often ineffective or causes intolerable side effects Presently catheter ablation delivered by radiofrequency energy RFA is the predominant procedure used for the treatment of tachycardias and may be curative or palliative This is the first synthesis of research studies and economic evaluations of RFA in Canada For the following conditions RFA is associated with a high procedural success rate and a low rate of complications within two years of follow up a Paroxysmal supraventricular tachycardia PSVT secondary to an accessory pathway b PSVT secondary to atrioventricular node re entry c Atrial flutter d Focal and re entrant atrial tachycardias For the following conditions catheter ablation is still within the research domain a Atrial fibrillation b Ventricular tachycardia VT in the setting of structural heart disease In adult patients with either symptomatic PSVT or VT patients with implantable defibrillators who experience frequent recurrences RFA is both more effective and less costly than drug therapy options For these patients RFA costs within US 21 000 C 33 000 per quality adjusted life year gained For all the different types of ablation procedures there is a paucity of high quality outcome studies comparing ablation with alternative therapies
