Modeling Engine Spray And Combustion Processes:

Modeling Engine Spray and Combustion Processes Gunnar Stiesch, 2013-06-29 The utilization of mathematical models to numerically describe the performance of internal combustion engines is of great significance in the development of new and improved engines Today such simulation models can already be viewed as standard tools and their importance is likely to increase further as available computer power is expected to increase and the predictive quality of the models is constantly enhanced This book describes and discusses the most widely used mathematical models for in cylinder spray and combustion processes which are the most important subprocesses affecting engine fuel consumption and pollutant emissions The relevant thermodynamic fluid dynamic and chemical principles are summarized and then the application of these principles to the in cylinder processes is explained Different modeling approaches for the each subprocesses are compared and discussed with respect to the governing model assumptions and simplifications Conclusions are drawn as to which model approach is appropriate for a specific type of problem in the development process of an engine Hence this book may serve both as a graduate level textbook for combustion engineering students and as a reference for professionals employed in the field of combustion engine modeling The research necessary for this book was carried out during my employment as a postdoctoral scientist at the Institute of Technical Combustion ITV at the University of Hannover Germany and at the Engine Research Center ERC at the University of Wisconsin Madison USA

Experiments and Numerical Simulations of Diluted Spray Turbulent Combustion Bart Merci, Dirk Roekaerts, AMSINI SADIKI, 2011-06-20 This book reflects the outcome of the 1st International Workshop on Turbulent Spray Combustion held in 2009 in Corsica France. The focus is on reporting the progress of experimental and numerical techniques in two phase flows with emphasis on spray combustion. The motivation for studies in this area is that knowledge of the dominant phenomena and their interactions in such flow systems is essential for the development of predictive models and their use in combustor and gas turbine design. This necessitates the development of accurate experimental methods and numerical modelling techniques. The workshop aimed at providing an opportunity for experts and young researchers to present the state of the art, discuss new developments or techniques and exchange ideas in the areas of experimentations, modelling and simulation of reactive multiphase flows. The first two papers reflect the contents of the invited lectures given by experts in the field of turbulent spray combustion. The first concerns computational issues while the second deals with experiments. These lectures initiated very interesting and interactive discussions among the researchers further pursued in contributed poster presentations. Contributions 3 and 4 focus on some aspects of the impact of the interaction between fuel evaporation and combustion on spray combustion in the context of gas turbines while the final article deals with the interaction between evaporation and turbulence. Process-Spray Udo Fritsching, 2016-08-01 This book describes the latest research on producing functional particles using spray processes. The authors detail micro level elementary processes and phase boundaries, process analysis, scaling and modeling and macro level process functions and particle properties. They include numerical simulations and particulars of experiments for deriving process conditions for particle production. Internal Combustion Processes of Liquid Rocket Engines Zhen-Guo Wang, 2016-05-17 This book concentrates on modeling and numerical simulations of combustion in liquid rocket engines covering liquid propellant atomization, evaporation of liquid droplets, turbulent flows, turbulent combustion, heat transfer and combustion instability. It presents some state of the art models and numerical methodologies in this area. The book can be categorized into two parts. Part 1 describes the modeling for each subtopic of the combustion process in the liquid rocket engines. Part 2 presents detailed numerical methodology and several representative applications in simulations of rocket engine combustion.

Alternative Diesel Fuels Daniel J Holt, 2004-01-01 A key topic of many technical discussions has been the development of alternative fuels to power the compression ignition engine Reasons for this include the desire to reduce the dependency on petroleum based fuel and at the same time to reduce the particulate matter PM and NOx emissions Also there has been interest generated in the diesel engine because of the reduction in greenhouse gases that has been proposed during the 2008 2012 time frame in Europe and the regulations that affect diesel engines in the United States *Development of a Diesel*
