THERMAL PHYSICS:

The branch of physics that study the temperature, heat energy and their relation to the matter.

Temperature:

It is the degree of hotness of an object, and it can be measured by thermometer. Temperature can be express by Celsius ($^{\circ}\text{C}$), Fahrenheit ($^{\circ}\text{F}$) or K scale.

Heat:

It is the energy which travels from high temperature to low temperature in a matter. It is also called thermal or internal energy. It is measured in joules (J)

Simple Kinetic Molecular Model of Matter

- Matter can exist in one of three different states:

Solid	Liquid	Gas
Fixed shape and volume	Fixed volume but changes shape depending on its container	No fixed shape or volume, gases fill up containers
Strong forces of attraction between particles- particles close to each other.	Weaker attractive forces than solids- medium distances between particles	Almost no intermolecular forces- large distances between particles
Fixed pattern (lattice)	No fixed pattern, liquids take shape of their container	Particles far apart, and move quickly
Atoms vibrate but can't change position $\therefore$ fixed volume and shape	Particles slide past each other.	Collide with each other and bounce in all directions

Conceptual Design of Multichip Modules and Systems Peter A. Sandborn, Hector Moreno, 2013-03-14 Conceptual Design of Multichip Modules and Systems treats activities which take place at the conceptual and specification level of the design of complex multichip systems These activities include the formalization of design knowledge information modeling tradeoff analysis partitioning and decision process capture All of these functions occur prior to the traditional CAD activities of synthesis and physical design Inherent in the design of electronic modules are tradeoffs which must be understood before feasible technology material process and partitioning choices can be selected The lack of a complete set of technology information is an especially serious problem in the packaging and interconnect field since the number of technologies process and materials is substantial and selecting optimums is arduous and non trivial if

one truly wants a balance in cost and performance Numerous tradeoff and design decisions have to be made intelligently and quickly at the beginning of the design cycle before physical design work begins These critical decisions made within the first 10% of the total design cycle ultimately define up to 80% of the final product cost Conceptual Design of Multichip Modules and Systems lays the groundwork for concurrent estimation level analysis including size routing electrical performance thermal performance cost reliability manufacturability and testing It will be useful both as a reference for system designers and as a text for those wishing to gain a perspective on the nature of packaging and interconnect design concurrent engineering computer aided design and system synthesis
