Nuclear Forces Introduction To Theoretical Nuclear Physics:

Nuclear Forces Gernot Eder, 1974-01 Nuclear Forces ; Introduction to Theoretical Nuclear Physics. Edder Gernot Edder, 1968 **Fundamentals in Nuclear Physics** Jean-Louis Basdevant, James Rich, Michael Spiro, 2006-01-16 Nuclear physics began one century ago during the miraculous decade between 1895 and 1905 when the foundations of practically all modern physics were established. The period started with two unexpected spin-offs of the Crookes vacuum tube: Roentgen's X-rays in 1895 and Thomson's electron in 1897, the first elementary particle to be discovered. Lorentz and Zeemann developed the theory of the electron and the influence of magnetism on radiation. Quantum phenomenology began in December 1900 with the appearance of Planck's constant, followed by Einstein's 1905 proposal of what is now called the photon. In 1905 Einstein also published the theories of relativity and of Brownian motion, the ultimate triumph of Boltzmann's statistical theory a year before his tragic death. For nuclear physics the critical discovery was that of radioactivity by Becquerel in 1896. By analyzing the history of science one can be convinced that there is some rationale in the fact that all of these discoveries came nearly simultaneously after the scientifically triumphant 19th century. The exception is radioactivity, an unexpected baby whose discovery could have happened several decades earlier. Talented scientists, the Curies, Rutherford and many others took the observation of radioactivity and constructed the idea that is the subject of this book. Of course the discovery of radioactivity and nuclear physics is of much broader importance. It led directly to quantum mechanics via Rutherford's planetary atomic model and Bohr's interpretation of the hydrogen spectrum. This in turn led to atomic physics, solid state physics and material science. *Theoretical Nuclear Physics in Italy* G. Pisent, 2001.
