## magnetic resonance imaging

Magnetic resonance imaging (MRI) uses a large electromagnet to subject the body to a strong magnetic field that aligns the hydrogen atoms in the body and produces an image that is clearer than radiography or CAT scans. It is important that clients do not have metal objects, such as metal plates, in their body.

Tissue Characterization in MR Imaging H. Peter Higer,Gernot Bielke,2012-12-06 H P HIGER 1 In the seventeenth century people dreamed about a machine to get rid of evil spirits and obsessions which were thought to be the main source of mis

fortune and disease I am not going to question this approach because in a way it sounds reasonable They dreamed of a machine that would display images from the inner world of men which could be easily identified and named Somehow these are the roots of MR imaging Of course we now view disease from a different point of view but our objectives remain the same namely to make diseases visible and to try to characterize them in order to cure them This was the reason for setting up a symposium on tissue characterization About 300 years later the clinical introduction of MRI has great potential for making this dream come true and I hope that this symposium has constituted another step toward its realization When Damadian published his article in 1971 about differences in T1 relaxation times between healthy and pathological tissues this was a milestone in tissue characterization His results initiated intensive research in to MR imaging and tissue parameters Actually his encouraging discovery was not only the first but also the last for a long time in the field of MR tissue characterization

[MRI of the Brain, Head, Neck and Spine](#)

Jaap Valk, 2012-12-06

With the growing number of MR installations clinicians and radiologists are being confronted more and more with visual information they do not feel as confident with as with the more mono form information of conventional radiographs CT and US. The freedom of parameter choice of the MR operator allows the same object to be depicted in various ways and the contrast in the images to be changed and inverted at will. For those not experienced in interpreting MR images this may cause confusion and uncertainty about their diagnostic content. This will sometimes lead to an unnecessary retreat to other diagnostic modalities. The purpose of this book is to help close the gap between MR operators and readers and clinicians. A variety of cases is presented together with the MRI considerations. In nearly all these cases confirmation of diagnosis was obtained by histological examination. Quite deliberately this book only includes the occasional CT scan or angiography for comparison to avoid the temptation of falling back on other modalities and of escaping from the often more difficult to interpret but in the end more rewarding MR images. All the MR images in this book were made with a first generation unsophisticated Teslacon I 0.6 T superconducting magnet system. Hopefully they will reflect the quality of the machine. Some people will agree with me that it is sad that investments in expensive health care systems are subject to the whims of those who are mainly interested in satisfying their stockholders.
