Advances on Nitrogen Use Efficiency in Crop Plants and Climatic Challenges Hamada AbdElgawad,2023-08-25

Nitrogen N is a mineral nutrient that is essential for the normal growth and development of plants that is required in the highest quantity It is an element of nucleic acids proteins and photosynthetic metabolites therefore crucial for crop growth and metabolic processes Recently it was estimated that N fertilizers could meet the 48% demand of the world s population However overuse and misuse of N fertilizers raised environmental concerns associated with N losses by nitrous oxide N₂O emissions ammonia NH₃ volatilization and nitrate NO₃ leaching For instance NH₃ is a pollutant in the atmosphere N₂O is a greenhouse gas that has a warming potential 298 times higher than CO₂ and contributes to ozone depletion and NO₃ causes eutrophication of water bodies Agricultural practices account for about 90% of NH₃ and 70% of N₂O anthropogenic emissions worldwide The efficient use of N chemical fertilizers can be attained through cultural and agronomic practices Nitrogen use efficiency NUE is an important trait that has been studied for decades in different crops The grain production or economic return from the per unit supply of N fertilizer simply explained the NUE Several definitions were suggested by different researchers NUE can be defined as the product of N uptake efficiency NUpE and N utilization efficiency NUtE An increase in NUE increases the yield biomass quality and quantity of crops N is generally applied as chemical fertilizer to the soil whereas a small amount is added to some crops like grain legumes through the fixation process On the other hand crop plants take N through the root system in the form of nitrate or ammonium which is thereby used in different metabolic processes A number of studies have been conducted to increase the NUE in different crops and it has been indicated that NUE can be improved by agronomic physiological biochemical breeding as well as molecular approaches Nitrogen is the main limiting nutrient after carbon hydrogen and oxygen for the photosynthetic process phyto hormonal and proteomic changes and the growth development of plants to complete their lifecycle Excessive and inefficient use of N fertilizer results in enhanced crop production costs and atmospheric pollution Atmospheric nitrogen 71% in the molecular form is not available for the plants For the world s sustainable food production and atmospheric benefits there is an urgent need to upgrade nitrogen use efficiency in the agricultural farming system Nitrogen losses are too high due to excess amount low plant population poor application methods etc which can go up to 70% of total available nitrogen These losses can be minimized up to 15 30% by adopting improved agronomic approaches such as optimal dosage of nitrogen application of N by using canopy sensors maintaining plant population drip fertigation and legume based intercropping Therefore the major concern of modern days is to save economic resources without sacrificing farm yield as well as the safety of the global environment i e greenhouse gas emissions ammonium volatilization and nitrate leaching

Climate Change through Gender Relations Susan Buckingham, Virginie Le Masson, 2017-05-08 This book explains how gender as a power relationship influences climate change related strategies and explores the additional pressures that climate change brings to uneven gender relations It considers the ways in which men and women experience the impacts of these in different economic contexts The chapters dismantle gender inequality and injustice through a critical appraisal of vulnerability and relative privilege within genders Part I addresses conceptual frameworks and international themes concerning climate change and gender and explores emerging ideas concerning the reification of gender relations in climate change policy Part II offers a wide range of case studies from the Global North and the Global South to illustrate and explain the limitations to gender blind climate change strategies This book will be of interest to students scholars practitioners and policymakers interested in climate change environmental science geography politics and gender studies

Climate Change and Ecosystems Shah Fahad, Muhammad Adnan, Shah Saud, Lixiao Nie, 2022-07-25 The global population is projected to increase by 3.3 billion from 6.7 billion in 2008 to 10 billion in 2100 As a result soil degradation and desertification are growing due to the increasing demand for food feed fiber and fuel on finite soil resources The problem of global food insecurity may be further worsened by the threat of global warming Climate change is showing its impacts in terms of increasing temperatures variable rainfall and an increase in climate related extremes such as floods droughts cyclones sea level rise salinity and soil erosion The agriculture sector is the most sensitive to climate change because the climate of a region country determines the nature and characteristics of vegetation and crops Increase in the mean seasonal temperature and decrease in effective precipitation can reduce the duration of many crops may lead to outbreaks of pests and diseases and hence reduce final yield ultimately affecting the food security of the country Despite the positive impact of CO₂ fertilization the net productivity may decrease because of an increase in respiration rate drought stress and nutrient deficiency For example for every 75 ppm increase in CO₂ concentration rice yields will increase by 0.5 t/ha but the yield will decrease by 0.6 t/ha for every 1 °C increase in temperature The global agricultural productivity is expected to decrease from 3% to 16% by 2080 The estimated decrease in agricultural productivity in the developing countries is 10% 25% in the 2080s where average air temperature is already near or above crop tolerance levels This book is intended to serve as a stimulating collection that will contribute to debate and reflection on the sustainable future of agriculture and food production in the face of global change Features This book brings together a multidimensional group of international scholars exploring the ethical dimensions of climate change and ecosystem New strategies have been pointed out in this book for better sustainable development This book has been designed to provide a good overview of major challenges facing policymakers researchers and ultimately humankind in dealing with climate change This book summarizes the diverse features of vulnerability adaptation and amelioration of climate change in respect to plants crops soil and microbes for the sustainability of the agricultural sector and ultimately food security for the future This book provides a state of the art description of the

physiological biochemical and molecular status of the understanding of abiotic stress in plants
