

UV radiation in our environment

The sun emits ultraviolet radiation (also called UVR or UV radiation). We cannot see or feel it. The sun's heat is from infrared rays but it is UV radiation that burns our skin.

Some UV radiation from the sun on our skin is good for our health because we make Vitamin D this way. However, too much UV radiation can cause our skin to age, develop skin cancers, and damage our eyes and immune systems. About 90% of skin cancers are caused by too much exposure to UVR.

Clouds

You can get sunburned on cloudy days. Cloud usually reduces UVR, particularly in overcast conditions. However, when there is broken cloud and the sun remains visible, clouds can scatter or reflect UVR so that total UVR may be greater than under clear sky conditions.

Latitude

In New Zealand, the peak summer UVR levels are around 40% higher than the same latitudes in the northern hemisphere.

Sun elevation

The amount of UVR varies with time of day and time of year. The higher the sun is in the sky, the higher the UVR. The shorter your shadow, the higher the UV index is. Be SunSmart during daylight saving months (September to April), especially between 10am and 4pm.

Altitude

In clean air, UVR increases by about 1% for each 1000 metre rise in altitude (going uphill). On our ski fields, the UV radiation can be 20-30% more than at sea level. Snow also reflects UVR. Be SunSmart both summer and winter when up in the mountains.

Working outdoors

Working outdoors means more time in the sun, more exposure to UVR and a greater risk of skin cancer.

Shade

Shade can reduce UV radiation. To reduce UVR by more than 50%, most of the sky needs to be blocked by the shade structure.

Reflection

UVR can be reflected or scattered by different surfaces. White sands can reflect up to 25% of UVR and snow can reflect 80% or more. Water also reflects high levels of UVR. Even under 50cm of water, UVR can still be 40% of its surface value.

Radiation In Our Environment:

Radioactivity in the Environment Vlado Valkovic, 2019-04-17 Radioactivity in the Environment Second Edition presents the facts on the presence of both natural and manmade radionuclides in the environment Sources of ionizing radiation that can lead to human exposure are discussed including natural sources nuclear explosions nuclear power generation the use of radiation in medical industrial and research purposes and radiation emitting consumer products In this thoroughly updated edition users will find new sections on developments in radioactive nuclides in nature and technologically modified exposure to natural radiation new threats by terrorist individuals groups and countries changes to the status of nuclear power in the world and more Additional new sections cover radioisotopes in geo prospecting and the oil industry the use of radiation in environmental protection detector types and detectors used for personal dosimetry the Dirty Bomb the Fukushima accident and North Korea testing sites and nuclear capabilities Includes details of analytical laboratory procedures for radioactivity measurement in different samples Features a new chapter on decontamination after radiation exposure Expands the discussion on nuclear fusion to cover ITER and other installations Radioactive Releases in the Environment John R. Cooper, Keith Randle, Ranjeet S. Sokhi, 2003-05-07 This text brings together in one single comprehensive reference the fundamentals of radioactivity It uniquely fills the gap in the market as no other books deal with environmental radioactivity to this degree Timely and invaluable as the studies of environmental processes and the awareness of the impact of human activity on our environment are increasing Links all three main aspects of environmental radioactivity Principles Transport and Measurement Useful to a wide readership students lecturers researchers companies and environmental consultants **Fluid Mechanics and Thermodynamics of Our Environment** S Eskinazi, 2012-12-02 Fluid Mechanics and Thermodynamics of Our Environment provides an introduction to the mechanical and thermodynamic properties of the environment The book begins with a discussion of the nature of the physical environment namely the earth the atmosphere and the oceans It then reviews the origin definitions and physical characteristics and relations of concepts affecting the state of the geofluid system Separate chapters cover the principles of heat transfer factors affecting the mechanical and thermal equilibrium of the environment the phenomenon of surface tension kinematics and dynamics of the environment inviscid motion of the atmospheric and oceanic free layers and the physical and mathematical behavior of the planetary boundary layer The final chapter discusses some applied problems pertaining to the environment These include problems involving the thermal plume hurricanes and the dynamic response of a balloon in a vortical atmospheric column This book was developed for engineering classes interested in the motion of the environment which is a main carrier of pollutants The selection of topics and the emphasis make the material primarily suited for engineering work Energy and the Environment Reza Toossi, 2009 Energy and the Environment is conceived and written at a level suitable for use as an introductory undergraduate textbook in energy and environment for students with very little mathematics or science background It can

also be used by anyone interested in technical political environmental and economical issues related to energy To make the text appropriate for engineering and science students additional topics are included within information boxes placed throughout the book and in the appendices Examples requiring algebra are indicated in a similar manner Depending on the audience instructors can decide to eliminate all or part of this material without loss of continuity Each chapter in Energy and the Environment stands alone and the text can be taught in any order that the instructor deems suitable Widely different curricula can therefore be designed and tailored for any audience simply by focusing on the appropriate sections from the appropriate chapters For example an environmental engineering course might include the summaries of various energy sources types with an emphasis on air pollution radiation and environmental economics A science curriculum might alternately emphasize the various technological sections and incorporate some of the engineering designs This book is now available and can be purchased at <http://vervepublishers.com> You may also order a free examination copy if you are considering adopting the Energy and the Environment for your classes I would be most pleased to receive comments and thank you for your time
