Radio Frequency Microelectronic Circuits For Telecommunication Applications:

Radio-Frequency Microelectronic Circuits for Telecommunication Applications Yannis E. Papananos, 2013-03-09
Radio Frequency Microelectronic Circuits for Telecommunication Applications covers the design issues of radio frequency microelectronic circuits for telecommunication applications with emphasis on devices and circuit level design. It uses a large number of real examples from industrial design as a vehicle both to teach the principles and to ensure relevance starting from device level modeling to basic RF microelectronic circuit cell design. Modeling for high frequency operation of both active and passive integrated devices is covered starting from the bipolar transistor to the MOS transistor to the modeling of integrated spiral inductors, resistors, capacitors, varactors, and package parasitics structures. A chapter is also devoted to the presentation of the basic definitions and terminology used in RF IC design. The book continues with the presentation of the principal building blocks of an integrated RF front end, namely the LNA, the mixer, the VCO, and integrated filters. Design paradigms are provided, classified on the technology used in each case: pure bipolar, CMOS, BiCMOS, or SiGe. **Radio Frequency Microelectronic Circuits for Telecommunication Applications** is essential reading for all researchers, practising engineers, and designers working in RF electronics. It is also a reference for use in advanced undergraduate or graduate courses in the same field.

Complex, Intelligent and Software Intensive Systems Leonard Barolli, 2022-06-16
Software intensive systems are systems which heavily interact with other systems: sensors, actuators, devices, other software systems, and users. More and more domains are involved with software intensive systems, e.g. automotive telecommunication systems, embedded systems in general, industrial automation systems, and business applications. Moreover, the outcome of web services delivers a new platform for enabling software intensive systems. Complex systems research is focused on the overall understanding of systems rather than its components. Complex systems are very much characterized by the changing environments in which they act by their multiple internal and external interactions. They evolve and adapt through internal and external dynamic interactions. The development of intelligent systems and agents, which is each time more characterized by the use of ontologies and their logical foundations, builds a fruitful impulse for both software intensive systems and complex systems. Recent research in the field of intelligent systems, robotics, neuroscience, artificial intelligence, and cognitive sciences is a very important factor for the future development and innovation of software intensive and complex systems. The aim of the book *Complex, Intelligent and Software Intensive Systems* is to deliver a platform of scientific interaction between the three interwoven challenging areas of research and development of future ICT enabled applications: software intensive systems, complex systems, and intelligent systems.
