

Types of Radionuclide Generators

1. Technetium Generators: Technetium-99m ($Tc-99m$) generators are the most widely utilized radionuclide generators in nuclear medicine.

Production: $Tc-99m$ is produced from the decay of its parent isotope, molybdenum-99 ($Mo-99$), which has a longer half-life.

Importance: $Tc-99m$ is a versatile radioisotope used in various diagnostic imaging procedures, including myocardial perfusion imaging, bone scans, and imaging of the liver, kidneys, and thyroid.

Advantages: Technetium generators provide a convenient and cost-effective method for producing $Tc-99m$ on-site, allowing for on-demand availability of this crucial radioisotope for medical imaging studies.

Radionuclide Generators, New Systems for Nuclear Medicine Applications, 1984 *The Development of New Radionuclide Generator Systems for Nuclear Medicine Applications*, 1991 Radioisotope generator systems have traditionally played a central role in nuclear medicine in providing radioisotopes for both research and clinical applications In this paper the development of several tungsten 188 rhenium 188 prototype generators which provide rhenium 188 for radioimmunotherapy RAIT is discussed The authors have recently demonstrated that carrier free iridium 194 can be obtained from the activated carbon system from decay of reactor produced osmium 194 for potential RAIT applications Instrumentation advances such as the new generation of high count rate fast gamma camera systems for first pass technology require the availability of generator produced ultra short lived radioisotopes for radionuclide angiography RNA The activated carbon generator is an efficient system to obtain ultra short lived iridium 191 m from osmium 191 for RNA In addition the growing number of PET centers has stimulated research in generators which provide positron emitting radioisotopes Copper 62 obtained from the zinc 62 generator is currently used for PET evaluation of organ perfusion The availability of the parent radioisotopes the fabrication and use of these generators and the practical factors for use of these systems in the radiopharmacy are discussed 74 refs 6 figs 5 tabs **Energy Research Abstracts**, 1993 Progress in Radiopharmacy August P. parent enables the user to have a short lived daughter while freeing him from the constraint of proximity to a cyclotron Systems where a short lived daughter is separated from a long lived parent are called radionuclide generators Two generator systems were developed for use in nuclear medicine one in diagnostic work and the other for therapeutic work The yield and breakthrough characteristics were within the limits required to minimize unnecessary radiation exposure in patients Two parent radionuclides were produced using sup 4 He beams available from medium energy cyclotrons The yield was high enough to produce generators that would be useful in clinical applications Radiotracers for Medical Applications
