Geologic Hazards of the Magna Quadrangle, Salt Lake County, Utah Jessica J. Castleton, Ashley Elliott, Greg N. McDonald, 2011-01-20 This study contains 10 1 24 000 scale GIS based geologic hazard maps that include liquefaction surface fault rupture flood hazard landslides rock fall indoor radon potential collapsible soils expansive soils shallow bedrock and shallow groundwater potential Also includes a 73 page accompanying report that describes the hazards and provides background information on data sources the nature and distribution of hazards and possible hazard reduction measures

Geology and Geologic Hazards of Tooele Valley and the West Desert Hazardous Industry Area, Tooele County, Utah Bill D. Black, Barry J. Solomon, Kimm M. Harty, 1999 The petrographic database consists of 705 maceral analyses reflectance measurements and density and porosity determinations from Utah coal samples These data were collected by the Utah Geological Survey from 1982 to 1995 Samples were collected from seven of Utah's 22 coal fields Coal fields sampled are the Book Cliffs 182 samples Wasatch Plateau 262 samples Emery 41 samples Sego 27 samples Henry Mountains 173 samples Kaiparowits Plateau 12 samples and Coalville four samples The data are sorted by coal field names within each field the analyses are arranged alphabetically by coal bed name to facilitate comparison The aim of the database is to provide the industry with information on petrographic properties of Utah coals In addition it should help the coal operators and purchasers to determine the best uses for Utah coals **The Oquirrh Fault Zone, Tooele County, Utah** Barry J. Solomon, Bill D. Black, 1996

Radon-hazard Potential of Beaver Basin Area, Beaver County, Utah Charles E. Bishop, 1998-01-20 Indoor radon levels in the Beaver basin of southwestern Utah are the highest recorded to date in Utah Measured indoor radon concentrations range from 17.5 to 495 pCi/L These levels are well above those considered a health risk by the U.S. Environmental Protection Agency Both geologic uranium content of soil depth to ground water soil permeability and non geologic weather home construction life style factors affect indoor radon levels In this study geologic factors are quantified and used to produce a radon hazard potential map of the Beaver basin area The map helps prioritize radon testing and evaluation and the need for radon resistant construction **Radon-hazard-potential Areas in Sandy, Salt Lake County, and Provo, Utah County, Utah** Barry J. Solomon, 1994

Radon-hazard Potential of the Lower Weber River Area, Tooele Valley, and Southeastern Cache Valley, Cache, Davis, Tooele, and Weber Counties, Utah Bill D. Black, Barry J. Solomon, 1996-01-01 Radon is a radioactive gas of geologic origin that is an environmental concern because of its link to lung cancer Radon is derived from the decay of uranium and can

accumulate indoors in sufficient quantities to pose a health hazard to building occupants Although the influence of non geologic factors such as construction type lifestyle and weather is difficult to measure geologic factors that influence indoor radon levels can be quantified to assess the hazard potential Geologic factors that influence indoor radon levels have been studied for three areas in northern Utah to indicate where indoor radon may be a hazard and radon resistant techniques should be considered in new construction The three areas include the lower Weber River area in Davis and Weber Counties Tooele Valley in Tooele County and southeastern Cache Valley in Cache County These areas all lie in the depositional basin of Pleistocene Lake Bonneville and display common geologic characteristics which affect their potential for radon hazards A numerical rating system was used to assess and map the relative radon hazard potential in the three study areas A high hazard potential was typically found along range fronts where uranium concentrations are higher ground water is deep and soils are permeable Although soil gas and indoor radon concentrations broadly correlate to mapped hazard potential the correlation is imperfect because of atmospheric contamination of soil gas samples the presence of locally anomalous concentrations of radon which are beyond the resolution of the sampling grid or map scale and the effects of non geologic factors which are not considered in this geologic assessment 56 pages 1 plate *Radon-hazard Potential in the Provo-Orem Area, Utah County, Utah* Barry J. 2016GUIDELINES FOR INVESTIGATING GEOLOGIC HAZARDS AND PREPARING ENGINEERING-GEOLOGY REPORTS, WITH A SUGGESTED APPROACH TO GEOLOGIC-HAZARD ORDINANCES IN UTAH Steve D. Bowman,William R. Lund,2016-09-21

The purpose of these guidelines for investigating geologic hazards and preparing engineering geology reports is to provide recommendations for appropriate minimum investigative techniques standards and report content to ensure adequate geologic site characterization and geologic hazard investigations to protect public safety and facilitate risk reduction Such investigations provide important information on site geologic conditions that may affect or be affected by development as well as the type and severity of geologic hazards at a site and recommend solutions to mitigate the effects and the cost of the hazards both at the time of construction and over the life of the development The accompanying suggested approach to geologic hazard ordinances and school site investigation guidelines are intended as an aid for land use planning and regulation by local Utah jurisdictions and school districts respectively Geologic hazards that are not accounted for in project planning and design often result in additional unforeseen construction and or future maintenance costs and possible injury or death
