Differential Equations: Techniques, Theory, and Applications Barbara D. MacCluer,Paul S. Bourdon,Thomas L. Kriete,2019-10-02

Differential Equations Techniques Theory and Applications is designed for a modern first course in differential equations either one or two semesters in length The organization of the book interweaves the three components in the subtitle with each building on and supporting the others Techniques include not just computational methods for producing solutions to differential equations but also qualitative methods for extracting conceptual information about differential equations and the systems modeled by them Theory is developed as a means of organizing understanding and codifying general principles Applications show the usefulness of the subject as a whole and heighten interest in both solution techniques and theory Formal proofs are included in cases where they enhance core understanding otherwise they are replaced by informal justifications containing key ideas of a proof in a more conversational format Applications are drawn from a wide variety of fields those in physical science and engineering are prominent of course but models from biology medicine ecology economics and sports are also featured The 1 400 exercises are especially compelling They range from routine calculations to large scale projects The more difficult problems both theoretical and applied are typically presented in manageable steps The hundreds of meticulously detailed modeling problems were deliberately designed along pedagogical principles found especially effective in the MAA study Characteristics of Successful Calculus Programs namely that asking students to work problems that require them to grapple with concepts or even proofs and do modeling activities is key to successful student experiences and retention in STEM programs The exposition itself is exceptionally readable rigorous yet conversational Students will find it inviting and approachable The text supports many different styles of pedagogy from traditional lecture to a flipped classroom model The availability of a computer algebra system is not assumed but there are many opportunities to incorporate the use of one

Handbook of Biomedical Image Analysis David Wilson, Swamy Laxminarayan, 2007-04-25 Our goal is to develop automated methods for the segmentation of thr dimensional biomedical images Here we describe the segmentation of c focal microscopy images of bee brains 20 individuals by registration to one or several atlas images Registration is performed by a highly parallel imp mentation of an entropy based nonrigid registration algorithm using B spline transformations We present and evaluate different methods to solve the cor spondence problem in atlas based registration An image can be segmented by registering it to an individual atlas an average atlas or multiple atlases When registering to multiple atlases combining the individual segmentations into a nalsegmentationcanbeachievedbyatlasselection ormulticlassi erdecision fusion

We describe all these methods and evaluate these segmentation accuracies that they achieve by performing experiments with electronic phantoms as well as by comparing their outputs to a manual gold standard. The present work is focused on the mathematical and computational theory behind a technique for deformable image registration termed Hyperelastic Warping and demonstration of the technique via applications in image registration and strain measurement. The approach combines well established principles of nonlinear continuum mechanics with forces derived directly from three dimensional image data to achieve registration. The general approach does not require the definition of landmarks, ducts or surfaces although it can accommodate these if available. Representative problems demonstrate the robust and flexible nature of the approach. Three dimensional registration methods are introduced for registering MRI volumes of the pelvis and prostate. The chapter first reviews the applications.
