## **Second Working Conference On Asynchronous Design Methodologies:**

**Lectures on Petri Nets II: Applications** Wolfgang Reisig, Grzegorz Rozenberg, 1998-11-04 The two volume set originates from the Advanced Course on Petri Nets held in Dagstuhl Germany in September 1996 beyond the lectures given there additional chapters have been commissioned to give a well balanced presentation of the state of the art in the area Together with its companion volume Lectures on Petri Nets I Basic Models this book is the actual reference for the area and addresses professionals students lecturers and researchers who are interested in systems design and would like to learn to use Petri nets familiar with subareas of the theory or its applications and wish to view the whole area interested in learning about recent results presented within a unified framework planning to apply Petri nets in practical situations interested in the relationship of Petri nets to other models of concurrent systems *Completion Detection in Asynchronous Circuits* Pallavi Srivastava, 2022-11-08 This book is intended for designers with experience in traditional clocked circuit design seeking information about asynchronous circuit design in order to determine if it would be advantageous to adopt asynchronous methodologies in their next design project The author introduces a generic approach for implementing a deterministic completion detection scheme for asynchronous bundled data circuits that incorporates a data dependent computational process taking advantage of the average case delay The author validates the architecture using a barrel shifter as shifting is the basic operation required by all the processors The generic architecture proposed in this book for a deterministic completion detection scheme for bundled data circuits will facilitate researchers in considering the asynchronous design style for developing digital circuits *Higher-Level Hardware Synthesis* Richard Sharp, 2004-03-18 In the mid 1960s when a single chip contained an average of 50 transistors Gordon Moore observed that integrated circuits were doubling in complexity every year In an influential article published by Electronics Magazine in 1965 Moore predicted that this trend would continue for the next 10 years Despite being criticized for its unrealistic optimism Moore's prediction has remained valid for far longer than even he imagined today chips built using state the art techniques typically contain several million transistors The advances in fabrication technology that have supported Moore's law for four decades have fuelled the computer revolution However this exponential increase in transistor density poses new design challenges to engineers and computer scientists alike New techniques for managing complexity must be developed if circuits are to take full advantage of the vast numbers of transistors available In this monograph we investigate both i the design of high level languages for hardware description and ii techniques involved in translating these hi level languages to silicon We propose SAFL a first order functional language designed specifically for behavioral hardware description and describe the implementation of its associated silicon compiler We show that the high level properties of SAFL allow one to exploit program analyses and optimizations that are not employed in existing synthesis systems Furthermore since SAFL fully abstracts the low level details of the implementation technology we show how it can be compiled to a range of different design styles including fully

synchronous design and globally asynchronous locally synchronous GALS circuits      *Advances in Computer Systems Architecture* Pen-Chung Yew, Jingling Xue, 2004-08-19 On behalf of the program committee we were pleased to present this year's program for ACSAC Asia Pacific Computer Systems Architecture Conference Now in its ninth year ACSAC continues to provide an excellent forum for researchers educators and practitioners to come to the Asia Pacific region to exchange ideas on the latest developments in computer systems architecture This year the paper submission and review processes were semiautomated using the free version of CyberChair We received 152 submissions the largest number ever Each paper was assigned at least three mostly four and in a few cases seven committee members for review All of the papers were reviewed in a 1 month period during which the program chairs regularly monitored the progress of the review process When reviewers claimed inadequate expertise additional reviewers were solicited In the end we received a total of 594 reviews 3.9 per paper from committee members as well as 248 coreviewers whose names are acknowledged in the proceedings We would like to thank all of them for their time and effort in providing us with such timely and high quality reviews some of them on extremely short notice      **Role Of Theory In Computer Science, The: Essays Dedicated To Janusz Brzozowski** Stavros Konstantinidis, Nelma Moreira, Rogerio Reis, Jeffrey Shallit, 2017-04-25 This volume brings together the work of several prominent researchers who have collaborated with Janusz Brzozowski or worked in topics he developed in the areas of regular languages syntactic semigroups of formal languages the dot depth hierarchy and formal modeling of circuit testing and software specification using automata theory      **Second International Symposium on Advanced Research in Asynchronous Circuits and Systems**, 1996      *Processor Architecture* Jurij Silc, Borut Robic, Theo Ungerer, 2012-12-06 Today's microprocessors are the powerful descendants of the von Neumann computer dating back to a memo of Burks Goldstine and von Neumann of 1946 The so called von Neumann architecture is characterized by a sequential control flow resulting in a sequential instruction stream A program counter addresses the next instruction if the preceding instruction is not a control instruction such as e.g. jump branch subprogram call or return An instruction is coded in an instruction format of fixed or variable length where the opcode is followed by one or more operands that can be data addresses of data or the address of an instruction in the case of a control instruction The opcode defines the types of operands Code and data are stored in a common storage that is linear addressed in units of memory words bytes words etc The overwhelming design criterion of the von Neumann computer was the minimization of hardware and especially of storage The most simple implementation of a von Neumann computer is characterized by a microarchitecture that defines a closely coupled control and arithmetic logic unit ALU a storage unit and an I/O unit all connected by a single connection unit The instruction fetch by the control unit alternates with operand fetches and result stores for the ALU      Evolvable Systems: From Biology to Hardware Kiyoshi Tanaka, Masaya Iwata, Tetsuya Higuchi, Moritoshi Yasunaga, 2003-06-30 On behalf of the ICES 2001 Conference Committee it is our pleasure to present to you the proceedings of the fourth International Conference on

Evolvable Systems From Biology to Hardware ICES 2001 held in Tokyo Japan on 3-5 October 2001 addressing the latest developments and discussing challenges facing the field of evolvable systems The idea of evolving machines whose origins can be traced back to the cybernetics movement of the 1940s and the 1950s has recently re-emerged in the form of the nascent field of bio-inspired systems and evolvable hardware Following the workshop Towards Evolvable Hardware which took place in Lausanne Switzerland in October 1995 the First International Conference on Evolvable Systems From Biology to Hardware ICES96 was held at the Electrotechnical Laboratory MITI Tsukuba Japan in October 1996 The second and the third International Conferences on Evolvable Systems From Biology to Hardware ICES98 and ICES 2000 were respectively held in Lausanne in September 1998 and in Edinburgh in April 2000 Following the success of these past events ICES 2001 was dedicated to the promotion and advancement of all aspects of evolvable systems including hardware software algorithms and applications By bringing together researchers who use biologically inspired concepts to implement real systems in artificial intelligence artificial life robotics VLSI design and related domains ICES 2001 reunited this burgeoning community

Advances in Computer Systems Architecture Amos Omondi, Stanislav Sedukhin, 2003-11-03 This conference marked the first time that the Asia Pacific Computer Systems Architecture Conference was held outside Australasia i.e. Australia and New Zealand and was we hope the start of what will be a regular event The conference started in 1992 as a workshop for computer architects in Australia and subsequently developed into a full-fledged conference covering Australasia Two additional major changes led to the present conference The first was a change from computer architecture to computer systems architecture a change that recognized the importance and close relationship to computer architecture of certain levels of software e.g. operating systems and compilers and of other areas e.g. computer networks The second change which reflected the increasing number of papers being submitted from Asia was the replacement of Australasia with Asia Pacific This year's event was therefore particularly significant in that it marked the beginning of a truly Asia Pacific conference It is intended that in the future the conference venue will alternate between Asia and Australia New Zealand and although still small we hope that in time the conference will develop into a major one that represents Asia to the same extent as existing major computer architecture conferences in North America and Europe represent those regions

*Euro-Par 2006 Parallel Processing* Wolfgang E. Nagel, Wolfgang V. Walter, 2006-08-24 This book constitutes the refereed proceedings of the 12th International Conference on Parallel Computing Euro-Par 2006 The book presents 110 carefully reviewed revised papers Topics include support tools and environments performance prediction and evaluation scheduling and load balancing compilers for high performance parallel and distributed databases data mining and knowledge discovery grid and cluster computing models middleware and architectures parallel computer architecture and instruction level parallelism distributed systems and algorithms and more
