Nonautonomous Dynamical Systems in the Life Sciences Peter E. Kloeden, Christian Pötzsche, 2014-01-22 Nonautonomous dynamics describes the qualitative behavior of evolutionary differential and difference equations whose right hand side is explicitly time dependent Over recent years the theory of such systems has developed into a highly active field related to yet recognizably distinct from that of classical autonomous dynamical systems This development was motivated by problems of applied mathematics in particular in the life sciences where genuinely nonautonomous systems abound The purpose of this monograph is to indicate through selected representative examples how often nonautonomous systems occur in the life sciences and to outline the new concepts and tools from the theory of nonautonomous dynamical systems that are now available for their investigation

Gradings on Simple Lie Algebras Alberto Elduque, Mikhail Kochetov, 2013 Gradings are ubiquitous in the theory of Lie algebras from the root space decomposition of a complex semisimple Lie algebra relative to a Cartan subalgebra to the beautiful Dempwolff decomposition of E_8 as a direct sum of thirty one Cartan subalgebras This monograph is a self contained exposition of the classification of gradings by arbitrary groups on classical simple Lie algebras over algebraically closed fields of characteristic not equal to 2 as well as on some nonclassical simple Lie algebras in positive characteristic Other important algebras also enter the stage matrix algebras the octonions and the Albert algebra Most of the presented results are recent and have not yet appeared in book form This work can be used as a textbook for graduate students or as a reference for researchers in Lie theory and neighbouring areas This book is published in cooperation with Atlantic Association for Research in the Mathematical Sciences AARMS

Hyperplane Arrangements Marcelo Aguiar, Swapneel Mahajan, 2017-11-22 This monograph studies the interplay between various algebraic geometric and combinatorial aspects of real hyperplane arrangements It provides a careful organized and unified treatment of several recent developments in the field and brings forth many new ideas and results It has two parts

each divided into eight chapters and five appendices with background material Part I gives a detailed discussion on faces flats chambers cones gallery intervals lunes and other geometric notions associated with arrangements The Tits monoid plays a central role Another important object is the category of lunes which generalizes the classical associative operad Also discussed are the descent and lune identities distance functions on chambers and the combinatorics of the braid arrangement and related examples Part II studies the structure and representation theory of the Tits algebra of an arrangement It gives a detailed analysis of idempotents and Peirce decompositions and connects them to the classical theory of Eulerian idempotents It introduces the space of Lie elements of an arrangement which generalizes the classical Lie operad This space is the last nonzero power of the radical of the Tits algebra It is also the socle of the left ideal of chambers and of the right ideal of Zie elements Zie elements generalize the classical Lie idempotents They include Dynkin elements associated to generic half spaces which generalize the classical Dynkin idempotent Another important object is the lune incidence algebra which marks the beginning of noncommutative Möbius theory These ideas are also brought upon the study of the Solomon descent algebra The monograph is written with clarity and in sufficient detail to make it accessible to graduate students It can also serve as a useful reference to experts

Mathematics Unlimited - 2001 and Beyond Björn Engquist, Wilfried Schmid, 2017-04-05 This is a book guaranteed to delight the reader. It not only depicts the state of mathematics at the end of the century but is also full of remarkable insights into its future development as we enter a new millennium. True to its title, the book extends beyond the spectrum of mathematics to include contributions from other related sciences. You will enjoy reading the many stimulating contributions and gain insights into the astounding progress of mathematics and the perspectives for its future. One of the editors Björn Engquist is a world renowned researcher in computational science and engineering. The second editor Wilfried Schmid is a distinguished mathematician at Harvard University. Likewise the authors are all foremost mathematicians and scientists and their biographies and photographs appear at the end of the book. Unique in both form and content, this is a must read for every mathematician and scientist and in particular for graduates still choosing their specialty. [Analytic Methods for Coagulation-Fragmentation Models, Volume I](#) Jacek Banasiak, Wilson Lamb, Philippe Laurencot, 2019-09-04 *Analytic Methods for Coagulation-Fragmentation Models* is a two volume set that provides a comprehensive exposition of the mathematical analysis of coagulation-fragmentation models. Initially an in depth survey of coagulation-fragmentation processes is presented together with an account of relevant early results obtained on the associated model equations. These provide motivation for the subsequent detailed treatment of more up to date investigations which have led to significant theoretical developments on topics such as solvability and the long term behaviour of solutions. To make the account as self contained as possible the mathematical tools that feature prominently in these modern treatments are introduced at appropriate places. The main theme of Volume I is the analysis of linear fragmentation models with Volume II devoted to processes that involve the nonlinear contribution of coagulation. Features of Volume I: The main models of the theory together with their derivations and early methods of solution. A detailed presentation of the operator theoretical methods and semigroup theory that play an essential role in the theory of fragmentation processes. A comprehensive theory of fragmentation processes including fragmentation with growth and decay in both the discrete and continuous particle size cases. An analytical explanation of the pathologies of the fragmentation equation such as the shattering phase transition and non uniqueness of solutions. An analysis of the long term dynamics of the discrete size fragmentation equation with growth. *The Serials Directory*, 1986

Theory Of Group Representations And Applications Ryszard Raczka, Asim Orhan Barut, 1986-11-01 The material collected in this book originated from lectures given by authors over many years in Warsaw, Trieste, Schladming, Istanbul, Göteborg and Boulder. There is no other comparable book on group representations neither in mathematical nor in physical literature and it is hoped that this book will prove to be useful in many areas of research. It is highly recommended as a textbook for an advanced course in mathematical physics on Lie algebras, Lie groups and their representations.
