Real Time Systems Specification Verification And Analysis:

Real-time Systems M. Joseph, Mathai Joseph, 1996 This text provides an account of real time systems The presentation makes use of recent research demonstrating the effectiveness and applicability of mathematically based methods for real time system design Each chapter focuses on a particular technique and examples help reinforce the theory

The SPIN Verification System Jean-Charles Grégoire, Gerard J. Holzmann, Doron A. Peled, 1997 What is SPIN SPIN is a general tool for the specification and formal verification of software for distributed systems It has been used to detect design errors in a wide range of applications such as abstract distributed algorithms data communications protocols operating systems code and telephone switching code The verifier can check for basic correctness properties such as absence of deadlock and race conditions logical completeness or unwarranted assumptions about the relative speeds of processes It can also check for more subtle system dependent correctness properties expressed in the syntax of Linear time Temporal Logic LTL The tool translates LTL formulae automatically into automata representations which can be used in an efficient on the fly verifications procedure This DIMACS volume presents the papers contributed to the second international workshop that was held on the SPIN verification system at Rutgers University in August 1996 The work covers theoretical and foundational studies of formal verifications empirical studies of the effectiveness of different types of algorithms significant practical applications of the SPIN verifier and discussions of extensions and revisions of the basic code This text will be of interest to those working in applications

Mathematics of Program Construction Roland Backhouse, Jose Nuno Oliveira, 2006-12-30 This volume contains the proceedings of MPC 2000 the fth international c ference on Mathematics of Program Construction This series of conferences aims to promote the development of mathematical principles and techniques that are demonstrably useful and usable in the process of constructing c puter programs whether implemented in hardware or software The focus is on techniques that combine precision with concision enabling programs to be constructed by formal calculation Within this theme the scope of the series is very diverse including programming methodology program speci cation and transformation programming paradigms programming calculi and progr ming language semantics The quality of the papers submitted to the conference was in general very high However the number of submissions has decreased compared to the pre ous conferences in the series Each paper was refereed by at least ve and often more committee members In order to maintain the high standards of the c ference the committee took a stringent view on quality this has meant that in some cases a paper was rejected even though there was a basis for a good c ference or journal paper but the submitted paper did not meet the committee s required standards In a few cases a good paper was rejected on the grounds that it did not t within the scope of the conference

a Difference Engine because it performed its calculations using the principle of partial differences was intended to substantially reduce the number of errors made by humans calculating the tables Babbage had also designed but never built a forerunner of the modern printer which would also reduce the number of errors admitted during the transcription of the results Nowadays a system implemented to perform the function of Babbage's engine would be classed as safety critical That is the failure of the system to produce correct results could result in the loss of human life mass destruction of property in the form of ships and cargo as well as financial losses and loss of competitive advantage for the shipping firm

Correct System Design Ernst-Rüdiger Olderog, Bernhard Steffen, 2003-06-26 Computers are gaining more and more control over systems that we use or rely on in our daily lives privately as well as professionally In safety critical applications as well as in others it is of paramount importance that systems controlled by a computer or computing systems

themselves reliably behave in accordance with the specification and requirements in other words here correctness of the system of its software and hardware is crucial In order to cope with this challenge software engineers and computer scientists need to understand the foundations of programming how different formal theories are linked together how compilers correctly translate high level programs into machine code and why transformations performed are justifiable This book presents 17 mutually reviewed invited papers organized in sections on methodology programming automation compilation and application
