Handbook of Preformulation Sarfaraz K. Niazi,2019-03-22 Preformulation studies are the physical chemical and biological studies needed to characterize a drug substance for enabling the proper design of a drug product whereas the effectiveness of a drug product is determined during the formulation studies phase Though the two disciplines overlap in practice each is a significantly distinct phase of new drug development Entirely focused on preformulation principles this fully revised and updated Handbook of Preformulation Chemical Biological and Botanical Drugs Second Edition provides detailed descriptions of preformulation methodologies gives a state of the art description of each technique and lists the currently available tools useful in providing a comprehensive characterization of a new drug entity Features Addresses the preformulation studies of three different types of new active entities chemical biological and botanical which is the latest established class of active ingredient classified by the FDA Illustrates the activities comprised in preformulation studies and establishes a method of tasking for drug development projects Includes extensive flow charts for

characterization decision making Gives extensive theoretical treatment of principles important for testing dissolution solubility stability and solid state characterization Includes over 50% new material **Geophysical Methods in Terrestrial Material Property Determinations** Emmanuel E. Blimptis,1975 In house and contractual research was conducted on the relationships between mechanical strength properties of rock and soil material and their electrical properties A theoretical study involved the quantum electromagnetic and elastic interactions of crystals and solids Laboratory and field investigations were made of the porosity and surface crack networks of large masses of quarry rocks which govern their conductivity and permittivity Thermal and mechanical stressing of rocks were analyzed Electrical parameters of deep mine rocks were measured in situ with emphasis on frequency conductivity relationships Direct mapping of rock strength as a function of electrical resistivity was investigated in the field A three dimensional modeling program was conducted in the laboratory Field measurements of dynamic electrical conductivity of various earth materials were made under conditions of a rapid stress generated by high explosive setonations Correlations demonstrated by this geophysical and geological research can be useful in prediction or evaluation of nuclear weapon shock effects on military installations
