Real Reductive Groups I:

Real Reductive Groups I Nolan R. Wallach, 1988-03-01 *Real Reductive Groups I* is an introduction to the representation theory of real reductive groups. It is based on courses that the author has given at Rutgers for the past 15 years. It also had its genesis in an attempt of the author to complete a manuscript of the lectures that he gave at the CBMS regional conference at The University of North Carolina at Chapel Hill in June of 1981. This book comprises 10 chapters and begins with some background material as an introduction. The following chapters then discuss elementary representation theory, real reductive groups, the basic theory of g K modules, the asymptotic behavior of matrix coefficients, The Langlands Classification, a construction of the fundamental series, cusp forms on G , character theory and unitary representations, and g K cohomology. This book will be of interest to mathematicians and statisticians.

Real Reductive Groups II, 1992-08-06 Real Reductive Groups II **Geometry and Representation Theory of Real and p -adic groups** Juan Tirao, David Vogan, Joe Wolf, 2012-12-06

The representation theory of Lie groups plays a central role in both classical and recent developments in many parts of mathematics and physics In August 1995 the Fifth Workshop on Representation Theory of Lie Groups and its Applications took place at the Universidad Nacional de Cordoba in Argentina Organized by Joseph Wolf Nolan Wallach Roberto Miatello Juan Tirao and Jorge Vargas the workshop offered expository courses on current research and individual lectures on more specialized topics The present volume reflects the dual character of the workshop Many of the articles will be accessible to graduate students and others entering the field Here is a rough outline of the mathematical content The editors beg the indulgence of the readers for any lapses in this preface in the high standards of historical and mathematical accuracy that were imposed on the authors of the articles Connections between flag varieties and representation theory for real reductive groups have been studied for almost fifty years from the work of Gelfand and Naimark on principal series representations to that of Beilinson and Bernstein on localization The article of Wolf provides a detailed introduction to the analytic side of these developments He describes the construction of standard tempered representations in terms of square integrable partially harmonic forms on certain real group orbits on a flag variety and outlines the ingredients in the Plancherel formula Finally he describes recent work on the complex geometry of real group orbits on partial flag varieties

The Langlands Classification and Irreducible Characters for Real Reductive Groups Jeffrey Adams, Dan Barbasch, David A. Vogan, 1992 This monograph explores the geometry of the local Langlands conjecture The conjecture predicts a parametrization of the irreducible representations of a reductive algebraic group over a local field in terms of the complex dual group and the Weil Deligne group For p -adic fields this conjecture has not been proved but it has been refined to a detailed collection of conjectural relationships between p -adic representation theory and geometry on the space of p -adic representation theory and geometry on the space of p -adic Langlands parameters In the case of real groups the predicted parametrization of representations was proved by Langlands himself Unfortunately most of the deeper relations suggested by the p -adic theory between real representation theory and geometry on the space of real Langlands parameters are not true The purpose of this book is to redefine the space of real Langlands parameters so as to recover these relationships informally to do Kazhdan Lusztig theory on the dual group The new definitions differ from the classical ones in roughly the same way that Deligne's definition of a Hodge structure differs from the classical one This book provides an introduction to some modern geometric methods in representation theory It is addressed to graduate students and research workers in representation theory and in automorphic forms

Harmonic Analysis and Representations of Semisimple Lie Groups J.A. Wolf, M. Cahen, M. de Wilde, 2012-12-06 This book presents the text of the lectures which were given at the NATO Advanced Study Institute on Representations of Lie groups and

Harmonic Analysis which was held in Liege from September 5 to September 17 1977 The general aim of this Summer School was to give a coordinated introduction to the theory of representations of semisimple Lie groups and to non commutative harmonic analysis on these groups together with some glance at physical applications and at the related subject of random walks As will appear to the reader the order of the papers which follows relatively closely the order of the lectures which were actually given follows a logical pattern The two first papers are introductory the one by R Blattner describes in a very progressive way a path going from standard Fourier analysis on $\mathbb{R}$ to non commutative harmonic analysis on a locally compact group the paper by J Wolf describes the structure of semisimple Lie groups the finite dimensional representations of these groups and introduces basic facts about infinite dimensional unitary representations Two of the editors want to thank particularly these two lecturers who were very careful to pave the way for the later lectures Both these chapters give also very useful guidelines to the relevant literature

Representation Theory of Semisimple Groups Anthony W.

Knapp,2016-06-02 In this classic work Anthony W Knapp offers a survey of representation theory of semisimple Lie groups in a way that reflects the spirit of the subject and corresponds to the natural learning process This book is a model of exposition and an invaluable resource for both graduate students and researchers Although theorems are always stated precisely many illustrative examples or classes of examples are given To support this unique approach the author includes for the reader a useful 300 item bibliography and an extensive section of notes

Representation Theory and Mathematical Physics

Jeffrey Adams,Bong Lian,Siddhartha Sahi,2011-11-07 This volume contains the proceedings of the conference on Representation Theory and Mathematical Physics in honor of Gregg Zuckerman's 60th birthday held October 24-27 2009 at Yale University Lie groups and their representations play a fundamental role in mathematics in particular because of connections to geometry topology number theory physics combinatorics and many other areas Representation theory is one of the cornerstones of the Langlands program in number theory dating to the 1970s Zuckerman's work on derived functors the translation principle and coherent continuation lie at the heart of the modern theory of representations of Lie groups One of the major unsolved problems in representation theory is that of the unitary dual The fact that there is in principle a finite algorithm for computing the unitary dual relies heavily on Zuckerman's work In recent years there has been a fruitful interplay between mathematics and physics in geometric representation theory string theory and other areas New developments on chiral algebras representation theory of affine Kac-Moody algebras and the geometric Langlands correspondence are some of the focal points of this volume Recent developments in the geometric Langlands program point to exciting connections between certain automorphic representations and dual fibrations in geometric mirror symmetry

Algebraic Groups and Lie Groups

Gus Lehrer,Alan L. Carey,1997-01-23 This volume

contains original research articles by many of the world's leading researchers in algebraic and Lie groups. Its inclination is algebraic and geometric although analytical aspects are included. The central theme reflects the interests of R. W. Richardson viz connections between representation theory and the structure and geometry of algebraic groups. All workers on algebraic and Lie groups will find that this book contains a wealth of interesting material. *Lie Groups Beyond an Introduction* Anthony W. Knap, 2013-03-09. Fifty years ago Claude Chevalley revolutionized Lie theory by publishing his classic *Theory of Lie Groups*. Before his book Lie theory was a mixture of local and global results. As Chevalley put it, "This limitation was probably necessary as long as general topology was not yet sufficiently well elaborated to provide a solid base for a theory in the large." These days are now passed. Indeed they are passed because Chevalley's book changed matters. Chevalley made global Lie groups into the primary objects of study. In his third and fourth chapters he introduced the global notion of an analytic subgroup so that Lie subalgebras corresponded exactly to analytic subgroups. This correspondence is now taken as absolutely standard and any introduction to general Lie groups has to have it at its core. Nowadays local Lie groups are a thing of the past; they arise only at one point in the development and only until Chevalley's results have been stated and have eliminated the need for the local theory. But where does the theory go from this point? Fifty years after Chevalley's book there are clear topics: E. Cartan's completion of W. Killing's work on classifying complex semisimple Lie algebras; the treatment of finite dimensional representations of complex semisimple Lie algebras and compact Lie groups by Cartan and H. Weyl; the structure theory begun by Cartan for real semisimple Lie algebras and Lie groups and harmonic analysis in the setting of semisimple groups as begun by Cartan and Weyl. **Lie Theory** Jean-Philippe Anker, Bent Ørsted, 2006-02-25. Semisimple Lie groups and their algebraic analogues over fields other than the reals are of fundamental importance in geometry, analysis and mathematical physics. Three independent self-contained volumes under the general title of *Lie Theory* feature survey work and original results by well-established researchers in key areas of semisimple Lie theory. *Harmonic Analysis on Symmetric Spaces: General Plancherel Theorems* presents extensive surveys by E. P. van den Ban, H. Schlichtkrull and P. Delorme of the spectacular progress over the past decade in deriving the Plancherel theorem on reductive symmetric spaces. Well suited for both graduate students and researchers in semisimple Lie theory and neighboring fields, possibly even mathematical cosmology, it provides a broad, clearly focused examination of semisimple Lie groups and their integral importance and applications to research in many branches of mathematics and physics. Knowledge of basic representation theory of Lie groups as well as familiarity with semisimple Lie groups, symmetric spaces and parabolic subgroups is required.

Representation Theory and Harmonic Analysis on Symmetric Spaces Jens Gerlach Christensen, Susanna Dann, Matthew Dawson, 2018-08-27. This volume contains the proceedings of the AMS Special Session on Harmonic Analysis in honor of Gestur Lafsson's 65th birthday held on January 4, 2017 in Atlanta, Georgia. The articles in this volume provide fresh perspectives on many different directions within harmonic analysis, highlighting the connections between harmonic analysis

and the areas of integral geometry complex analysis operator algebras Lie algebras special functions and differential operators The breadth of contributions highlights the diversity of current research in harmonic analysis and shows that it continues to be a vibrant and fruitful field of inquiry *Representation Theory Of Lie Groups And Lie Algebras - Proceedings Of Fuji-kawaguchiko Conference* Takeshi Kawazoe, Toshio Oshima, S Sano, 1992-08-07 The proceedings in this volume covers recent developments of representation theory of real Lie groups Lie algebras harmonic analysis on homogeneous spaces their applications and related topics **Noncommutative Harmonic Analysis** Patrick Delorme, Michèle Vergne, 2012-12-06

Dedicated to Jacques Carmona an expert in noncommutative harmonic analysis the volume presents excellent invited refereed articles by top notch mathematicians Topics cover general Lie theory reductive Lie groups harmonic analysis and the Langlands program automorphic forms and Kontsevich quantization Good text for researchers and grad students in representation theory **The Endoscopic Classification of Representations Orthogonal and Symplectic Groups**

James Arthur, 2013-10-31 Within the Langlands program endoscopy is a fundamental process for relating automorphic representations of one group with those of another In this book Arthur establishes an endoscopic classification of automorphic representations of orthogonal and symplectic groups The representations are shown to occur in families known as global packets and packets which are parametrized by certain self dual automorphic representations of an associated general linear group The central result is a simple and explicit formula for the multiplicity in the automorphic discrete spectrum of for any representation in a family The results of the volume have already had significant applications to the local Langlands correspondence the construction of unitary representations the existence of Whittaker models the analytic behaviour of Langlands functions the spectral theory of certain locally symmetric spaces and to new phenomena for symplectic epsilon factors One can expect many more In fact it is likely that both the results and the techniques of the volume will have applications to almost all sides of the Langlands program The methods are by comparison of the trace formula of with its stabilization and a comparison of the twisted trace formula of with its stabilization which is part of work in progress by Mœglin and Waldspurger This approach is quite different from methods that are based on functions converse theorems or the theta correspondence The comparison of trace formulas in the volume ought to be applicable to a much larger class of groups Any extension at all will have further important implications for the Langlands program

Representation Theory and Harmonic Analysis on Semisimple Lie Groups Paul J. Sally (Jr.), David A. Vogan, 1989 This book brings together five papers that have been influential in the study of Lie groups Though published more than 20 years ago these papers made fundamental contributions that deserve much broader exposure In addition the subsequent literature that has subsumed these papers cannot replace the originality and vitality they contain The editors have provided a brief introduction to each paper as well as a synopsis of the major developments which have occurred in the area covered by each paper Included here are the doctoral theses of Arthur Osborne and Schmid Arthur s thesis is closely related to Trombi s

paper insofar as both deal with harmonic analysis on real semisimple Lie groups and in particular analysis on the Schwartz space of Harish Chandra Arthur's thesis is concerned with the image under the Fourier transform of the Schwartz space of a semisimple Lie group of real rank one while Trombi's paper provides an expository account of the harmonic analysis associated to the decomposition of the Schwartz space under the regular representation In his thesis Osborne extends the Atiyah Bott fixed point theorem for elliptic complexes to obtain a fixed point formula for complexes that are not elliptic Schmid proves a generalization of the Borel Weil theorem concerning an explicit and geometric realization of the irreducible representations of a compact connected semisimple Lie group Langlands's fundamental paper provides a classification of irreducible admissible representations of real reductive Lie groups
