Receptor Localization Laboratory Methods And Procedures:

Receptor Localization Marjorie Ariano, 1998-07-16 The detection of neurotransmitter receptor locations and distribution densities within the central nervous system and peripheral tissues is receiving intense attention within the neuroscience research community. Neurotransmitter receptors which receive the chemical signals sent from one neuron to another are critical links in a highly complex information processing chain. Pinpointing receptor sites and systems is crucial for understanding neurological function as well as dysfunction. It is also essential for understanding how receptors process information when impacted by such substances as heroin or nicotine or when affected by neurodegenerative disease. *Receptor Localization Laboratory Methods and Procedures* is the first user friendly guide to the latest techniques and approaches being employed to examine the localization of neurotransmitter receptors in the central nervous system and peripheral tissues. It covers detection methods that are applicable to a wide variety of receptor systems ranging from genes and ligands to in vivo receptors in individuals and to numerous receptor subtypes such as nicotine, muscarine, tachykinins, dopamine, adenosine and GABA. The standard laboratory recipes or tricks employed in these detection methods are fully discussed as are the advantages and limitations of each procedure. With contributions from leading experts and extensively illustrated, this book discusses receptor ligand binding methods using irreversible and reversible compounds. Presents antireceptor antisera technology using synthetic peptides and fusion proteins at both the cellular and subcellular resolution levels. Examines molecular assessments of receptors. Describes in situ hybridization, reverse transcriptase PCR and fluorescent in situ transcription. Covers new visualization paradigms. Includes physiological analysis of receptor function, cellular detection in the brain slice and cultured neurons. Discusses the use of PET and SPECT to assess in vivo receptor distributions in animals and humans. *Receptor Localization Laboratory Methods and Procedures* is an invaluable guide for researchers in the related fields of neurology, biochemistry and pharmacology. Its lucid descriptions of new detection methods, inclusion of experimental examples and emphasis on how these experimental approaches are applicable to particular research areas will appeal to both the experienced researcher and novice investigator.

Regulation of G Protein Coupled Receptor Function and Expression Jeffrey L. Benovic, 1999-11-12 Recent advances in molecular and cell biology enabling the cloning, expression and mutagenesis of signal transduction proteins has prompted an explosion of knowledge in the field of receptor regulation, facilitating the discovery of new classes of regulatory proteins and providing a basis and means for manipulating receptor function through multiple intracellular targets. This volume covers methods used to examine how the functions of receptors are regulated. Understanding how to regulate the function and expression of these receptors is critical in determining how to modify receptors and to translocate receptors away from the cell surface and its recycling. Individual chapters focus on specific techniques used to characterize receptors: epitope tagging, measurement and analysis of receptor phosphorylation, analysis of the kinetics of receptor desensitization and assessment of receptor G protein coupling, the role of

regulatory proteins receptor kinases and phosphatases arrestins in modulating receptor function and the methods used to measure receptor trafficking ligand binding immunofluorescence and expression transcriptional and translational regulation Covers a broad range of important concepts and methodologies which are current in the study of G protein coupled receptors GPCRs G protein coupled receptors make up over 40% of the current pharmacological targets Provides detailed protocols for executing various strategies and offers informed judgments as to what approaches are and aren't useful Volume Editor

Jeffrey Benovic is a dominant world leader in the study of receptor regulation of GPCR kinases and is highly respected in the field NMDA Receptor Protocols Min Li, 2008-02-03 Min Li and a panel of hands on experimentalists detail state of the art molecular techniques for studying NMDA ligand gated ion channels and developing assays for nontherapeutic lead selection The topics range from cDNA cloning to in vitro and in vivo investigation of the channel complex in the mammalian brain Additional topics include the biochemical analysis of the channel protein and the construction of various heterologous systems for both basic research and high throughput screens HTS for pharmaceutical chemicals Although the focus is on NMDA receptors the methods are applicable to other ligand gated ion channels and with some modification may be extended to related membrane signaling receptors NMDA Receptor Protocols offers today's scientists powerful methods for basic research on NMDA receptor structure and function as well as enormous opportunities for clinical investigation toward the development of novel bioactive compounds **Dopamine Handbook** Leslie L. Iversen, 2010
