Mathematical Modelling Framework for the Degradation of Bioresorbable Composites Ismael

Moreno-Gomez, 2019-04-05 This book presents a generalised computational model for the degradation of resorbable composites using analytic expressions to represent the interwoven phenomena present during degradation It then combines this modelling framework with a comprehensive database of quantitative degradation data mined from existing literature and from novel experiments to provide new insights into the interrelated factors controlling degradation Resorbable composites made of biodegradable polyesters and calcium based ceramics have significant therapeutic potential as tissue engineering scaffolds as temporary implants and as drug loaded matrices for controlled release However their degradation is complex and the rate of resorption depends on multiple connected factors such as the shape and size of the device polymer chemistry and molecular weight particle phase size volume fraction distribution and pH dependent dissolution properties

Understanding and ultimately predicting the degradation of resorbable composites is of central importance if we are to fully unlock the promise of these materials **Fuels and Lubricants Handbook , Polymer Technology Dictionary A.**
