

# Virtual Aesthetic Simulator

Virtual reality at the service of controlled aesthetic watchmaking.

## Our Product

### Virtual Aesthetic Simulator (VAS)

ASCA has developed, in collaboration with the Geneva watchmaking school, a fault simulator on a mechanical gear. This allows students to train students in more depth in the profession of quality controller. This tool combined with an LMS (Learning Management System) or the integrated management interface makes it possible to optimize aesthetic control training in a fun and efficient way.

## Aesthetic Control

### HOW TO CONTROL IT?

- Adopting a simple and unambiguous language for a common understanding of aesthetic quality of the components.
- By using a semantic reference matrix associating the types of components, components with precise functions, the criteria with the intensity levels defined with the company.
- Defining the compliance thresholds of the components of product.
- Providing uniform training in operational competence for those responsible for aesthetic control.
- By assigning a specific role to each teaching.
- By regularly assessing the competence to measure progress in a sustainable way (KPIs), of a component or product.

### Lighten the management of physical components

Companies must manage and maintain sets of physical components used as a "vocabulary" for the training of aesthetic testers.

The cost of managing a set of physical parts representing all combinations of shapes, defect types, materials and finishes is very high.

VAS allows the company to significantly reduce its management burden by adding standards or products in 3D and then virtually adding typical aesthetic phenomena.

### VAS Allows

- Streamline the management of components used as standards for aesthetic control training.
- To make companies aware of aesthetic control and its importance for the client.
- Integrate aesthetic control into a total quality management (TQM) approach with precise indicators at all stages of the manufacturing and after-sales.
- Provide the after-sales service with an efficient tool to record the aesthetic aspect of the supported product.

### Raising awareness of criteria and aesthetic vocabulary

Aesthetic defects are often the result of careless handling of the components and products concerned, whether during manufacture, assembly or marketing.

By making the VAS platform available to staff in direct contact with the product, it becomes very easy to make them aware of the evaluation criteria and the aesthetic vocabulary defined by the company.

### Improve after-sales Service Returns

The VAS platform can easily be used by the service network to report back in the information system or database of the company.

It is also a very useful way to indicate, in accordance with the product nomenclature, a precise reference to the defect type, material and finish, in order to draw up a precise repair estimate or to declare market return.

### Improving the total quality approach

During the entire product life cycle, from design through customer service to distribution, the VAS application makes it possible to build up a database of aesthetic defects in a simple, efficient and computerized way.

On this basis of consolidated data, it is then possible to establish a common aesthetic vocabulary, thus enabling solutions to be found to correct, improve and optimize the product, process or service offered.

### A semantic matrix of aesthetic defects

VAS is based on a semantic matrix that defines 5 levels of intensity for each of the 5 types of aesthetic defects: references: Scratches - Marks - Deformations - Stains - Uniformity.

**Foundations of Empirical Software Engineering** Barry Boehm, Hans Dieter Rombach, Marvin V. Zelkowitz, 2005-05-13

Although software engineering can trace its beginnings to a NATO conference in 1968 it cannot be said to have become an empirical science until the 1970s with the advent of the work of Prof Victor Robert Basili of the University of Maryland. In addition to the need to engineer software was the need to understand software. Much like other sciences such as physics, chemistry, and biology, software engineering needed a discipline of observation, theory formation, experimentation, and feedback. By applying the scientific method to the software engineering domain, Basili developed concepts like the Goal Question Metric method, the Quality Improvement Paradigm, and the Experience Factory to help bring a sense of order to the ad hoc developments so prevalent in the software engineering field. On the occasion of Basili's 65th birthday, we present this book containing reprints of 20 papers that defined much of his work. We divided the 20 papers into 6 sections, each describing a different facet of his work, and asked several individuals to write an introduction to each section. Instead of describing the scope of this book in this preface, we decided to let one of his papers, the keynote paper he gave at the International Conference on Software Engineering in 1996 in Berlin, Germany, to lead off this book. He better than we can best describe his views on what is *perimental software engineering*.      *Concurrent Programming* Narain Gehani, Andrew D. McGettrick, 1988

Today, computers fulfil a dazzling array of roles, a flexibility resulting from the great range of programs that can be run on them. *A Science of Operations* examines the history of what we now call programming, defined not simply as computer programming but more broadly as the definition of the steps involved in computations and other information processing activities. This unique perspective highlights how the history of programming is distinct from the history of the computer, despite the close relationship between the two in the 20th century. The book also discusses how the development of programming languages is related to disparate fields which attempted to give a mechanical account of language on the one hand and a linguistic account of machines on the other. Topics and features: Covers the early development of automatic computing, including Babbage's mechanical calculating engines and the applications of punched card technology; examines the theoretical work of mathematical logicians such as Kleene, Church, Post, and Turing, and the machines built by Zuse and Aiken in the 1930s and 1940s; discusses the role that logic played in the development of the stored program computer; describes the standard model of machine code programming popularised by Maurice Wilkes; presents the complete table for the universal Turing machine; in the Appendices, investigates the rise of the initiatives aimed at developing higher level programming notations and how these came to be thought of as languages that could be studied independently of a machine; examines the importance of the

Algol 60 language and the framework it provided for studying the design of programming languages and the process of software development and explores the early development of object oriented languages with a focus on the Smalltalk project This fascinating text offers a new viewpoint for historians of science and technology as well as for the general reader The historical narrative builds the story in a clear and logical fashion roughly following chronological order     *Models and Theories of Speech Production* Adamantios Gafos,Pascal van Lieshout,2020-08-07     **Catalogue of Publications Issued by the Government of the United States** United States.
