

The Programming Language Pascal

N. WIRTH *

Received October 30, 1970

Summary. A programming language called Pascal is described which was developed on the basis of ALGOL 60. Compared to ALGOL 60, its range of applicability is considerably increased due to a variety of data structuring facilities. In view of its intended usage both as a convenient basis to teach programming and as an efficient tool to write large programs, emphasis was placed on keeping the number of fundamental concepts reasonably small, on a simple and systematic language structure, and on efficient implementability. A one-pass compiler has been constructed for the CDC 6000 computer family; it is expressed entirely in terms of Pascal itself.

1. Introduction

The development of the language *Pascal* is based on two principal aims. The first is to make available a language suitable to teach programming as a systematic discipline based on certain fundamental concepts clearly and naturally reflected by the language. The second is to develop implementations of this language which are both reliable and efficient on presently available computers, dispelling the commonly accepted notion that useful languages must be either slow to compile or slow to execute, and the belief that any nontrivial system is bound to contain mistakes forever.

There is of course plenty of reason to be cautious with the introduction of yet another programming language, and the objection against teaching programming in a language which is not widely used and accepted has undoubtedly some justification—at least based on short-term commercial reasoning. However, the choice of a language for teaching based on its widespread acceptance and availability, together with the fact that the language most widely taught is thereafter going to be the one most widely used, forms the safest recipe for stagnation in a subject of such profound paedagogical influence. I consider it therefore well worth-while to make an effort to break this vicious circle.

Of course a new language should not be developed just for the sake of novelty; existing languages should be used as a basis for development wherever they meet the chosen objectives, such as a systematic structure, flexibility of program and data structuring, and efficient implementability. In that sense ALGOL 60 was used as a basis for Pascal, since it meets most of these demands to a much higher degree than any other standard language [1]. Thus the principles of structuring, and in fact the form of expressions, are copied from ALGOL 60. It was, however, not deemed appropriate to adopt ALGOL 60 as a subset of Pascal; certain construction principles, particularly those of declarations, would have been incom-
