Numerical Analysis 1995:

Numerical Analysis 1995 D.F. Griffiths, G.A. Watson, 1996-04-11 This volume contains invited papers presented at the 16th Dundee Biennial Conference on Numerical Analysis held at the University of Dundee 27-30 June 1995. The Dundee Conferences are important events in the numerical analysis calendar and the thirteen papers published here represent accounts of recent research work by leading numerical analysts covering a wide range of fields of interest. The book is a valuable guide to the direction of current research in many areas of numerical analysis. It will be of particular interest to graduate students and research workers concerned with the theory and application of numerical methods for solving ordinary and partial differential equations with emphasis on problems in fluid dynamics. It also contains contributions to research into methods of linear algebra, numerical methods for optimisation problems and surface fitting. Numerical Analysis 1995, 1996

The Mathematics of Numerical Analysis James Renegar, 1996 The lectures in this volume are the proceedings from the 1995 AMS SIAM Summer Seminar in Applied Mathematics held in Park City, UT. The mathematical theory of real number algorithms was the subject of the conference with emphasis on geometrical, algebraic, analytic and foundational perspectives. Investigations on efficiency played a special role. The goal of the conference was to give the topic of numerical analysis greater coherence by focusing on the mathematical side. Particular attention was aimed at strengthening the unity of mathematics and numerical analysis and narrowing the gap between pure and applied mathematics. The conference was international in character with strong representation from the most mathematically developed parts of numerical analysis. Seminars in following areas were held: linear algebra, nonlinear systems, path following, differential equations, linear programming, interval arithmetic, algebraic questions, foundations, information based complexity, lower bounds and approximation theory.

Acta Numerica 1995: Volume 4 Arieh Iserles, 1995-07-13 Acta Numerica has established itself as the prime forum for the presentation of definitive reviews of numerical analysis topics. The invited review papers by leaders in their respective fields allow researchers and graduate students alike quickly to grasp trends and developments. Highlights of the 1995 issue include articles on sequential, quadratic programming, mesh adaption, free boundary problems and particle methods in continuum computations.

Numerical Methods in Scientific Computing: Germund Dahlquist, Ake Björck, 2008-09-04 This work addresses the increasingly important role of numerical methods in science and engineering. It combines traditional and well developed topics with other material such as interval arithmetic, elementary functions, operator series, convergence, acceleration and continued fractions.

Numerical Methods for Singularly Perturbed Differential Equations Hans-Görg Roos,Martin Stynes,Lutz Tobiska,2013-06-29 The analysis of singular perturbed differential equations began early in this century when approximate solutions were constructed from asymptotic expansions Preliminary attempts appear in the nineteenth century vD94 This technique has flourished since the mid 1960s Its principal ideas and methods are described in several textbooks Nevertheless asymptotic expansions may be impossible to construct or may fail to simplify the given problem then numerical approximations are often the only option The systematic study of numerical methods for singular perturbation problems started somewhat later in the 1970s While the research frontier has been steadily pushed back the exposition of new developments in the analysis of numerical methods has been neglected Perhaps the only example of a textbook that concentrates on this analysis is DMS80 which collects various results for ordinary differential equations but many methods and techniques that are relevant today especially for partial differential equations were developed after 1980 Thus contemporary researchers must comb the literature to acquaint themselves with earlier work Our purposes in writing this introductory book are twofold First we aim to present a structured account of recent ideas in the numerical analysis of singularly perturbed differential equations Second this important area has many open problems and we hope that our book will stimulate further investigations Our choice of topics is inevitably personal and reflects our own main interests

Masters Theses in the Pure and Applied Sciences Wade H. Shafer,2012-12-06 Masters Theses in the Pure and Applied Sciences was first conceived published and disseminated by the Center for Information and Numerical Data Analysis and Synthesis CINDAS at Purdue University in 1957 starting its coverage of theses with the academic year 1955 Beginning with Volume 13 the printing and dissemination phases of the activity were transferred to University Microfilms Xerox of Ann Arbor Michigan with the thought that such an arrangement would be more beneficial to the academic and general scientific and technical community After five years of this joint undertaking we had concluded that it was in the interest of all concerned if the printing and distribution of the volumes were handled by an international publishing house to assure improved service and broader dissemination Hence starting with Volume 18 Masters Theses in the Pure and Applied Sciences has been disseminated on a worldwide basis by Plenum Publishing Corporation of New York and in the same year the coverage was broadened to include Canadian universities All back issues can also be ordered from Plenum We have reported in Volume 40 thesis year 1995 a total of 10 746 thesis titles from 19 Canadian and 144 United States universities We are sure that this broader base for these titles reported will greatly enhance the value of this important annual reference work While Volume 40 reports theses submitted in 1995 on occasion certain universities do report theses submitted in

Tractability of Multivariate Problems: Linear information Erich Novak, H. Woźniakowski, 2008 Multivariate problems occur in many applications These problems are defined on spaces of d variate functions and d can be huge in the hundreds or even in the thousands Some high dimensional problems can be solved efficiently to within ϵ i.e the cost increases polynomially in $1/\epsilon$ and d However there are many multivariate problems for which even the minimal cost increases exponentially in d This exponential dependence on d is called intractability or the curse of dimensionality This is the first volume of a three volume set comprising a comprehensive study of the tractability of multivariate problems It is devoted to tractability in the case of algorithms using linear information and develops the theory for multivariate problems in various settings worst case average case randomized and probabilistic A problem is tractable if its minimal cost is not exponential in $1/\epsilon$ and d There are various notions of tractability depending on how we measure the lack of exponential dependence For example a problem is polynomially tractable if its minimal cost is polynomial in $1/\epsilon$ and d The study of tractability was initiated about 15 years ago This is the first and only research monograph on this subject Many multivariate problems suffer from the curse of dimensionality when they are defined over classical unweighted spaces In this case all variables and groups of variables play the same role which causes the minimal cost to be exponential in d But many practically important problems are solved today for huge d in a reasonable time One of the most intriguing challenges of the theory is to understand why this is possible Multivariate problems may become weakly tractable polynomially tractable or even strongly polynomially tractable if they are defined over weighted spaces with properly decaying weights One of the main purposes of this book is to study weighted spaces and obtain necessary and sufficient conditions on weights for various notions of tractability The book is of interest for researchers working in computational mathematics especially in approximation of high dimensional problems It may be also suitable for graduate courses and seminars The text concludes with a list of thirty open problems that can be good candidates for future tractability research
