

Nutrition & Metabolism

What is nutrition?

Good nutrition is the cornerstone of human development and survival. Nutrition describes the process of food for energy, growth and other purposes. The individual is food for the body and growth energy. The use of food for energy and growth can be described as nutrition. Nutrition is the process of food for energy, growth and other purposes. The use of food for energy and growth can be described as nutrition. Nutrition is the process of food for energy, growth and other purposes. The use of food for energy and growth can be described as nutrition.

Basal metabolic rate

The basal metabolic rate (BMR) is the amount of energy used when a person is at rest, awake, and in a thermally neutral environment. It is the minimum amount of energy required to maintain the body's basic functions, such as breathing, circulation, and cell production. BMR is influenced by factors such as age, sex, body composition, and genetics. The rate of BMR is usually higher in men than in women, and higher in younger people than in older people. BMR is also higher in people with more muscle mass than in people with less muscle mass.

Factors affecting the metabolic rate

- Genetics
- Sex
- Body composition
- Level of activity
- Age
- Environmental factors

What is metabolism?

The body and its organs use metabolism to produce energy and to build and repair the body. Metabolism is the process by which the body converts food and other substances into energy and building blocks. Metabolism is a complex process involving many different chemical reactions. The body uses metabolism to produce energy and to build and repair the body. Metabolism is the process by which the body converts food and other substances into energy and building blocks. Metabolism is a complex process involving many different chemical reactions.

Metabolic pathways

The two main types of metabolic pathways are catabolic and anabolic. Catabolic pathways break down large molecules into smaller molecules, releasing energy in the process. Anabolic pathways build up large molecules from smaller molecules, using energy in the process. Metabolic pathways are essential for the body to function properly.

Food metabolism

Food metabolism is the process by which the body converts food into energy and building blocks. The digestive system breaks down food into small molecules that can be absorbed by the body. The body then uses these molecules to produce energy and to build and repair the body. Food metabolism is a complex process involving many different chemical reactions.

Protein metabolism

Protein metabolism is the process by which the body converts protein into energy and building blocks. The digestive system breaks down protein into small molecules that can be absorbed by the body. The body then uses these molecules to produce energy and to build and repair the body. Protein metabolism is a complex process involving many different chemical reactions.

Carbohydrate metabolism

Carbohydrate metabolism is the process by which the body converts carbohydrates into energy and building blocks. The digestive system breaks down carbohydrates into small molecules that can be absorbed by the body. The body then uses these molecules to produce energy and to build and repair the body. Carbohydrate metabolism is a complex process involving many different chemical reactions.

Fat metabolism

Fat metabolism is the process by which the body converts fat into energy and building blocks. The digestive system breaks down fat into small molecules that can be absorbed by the body. The body then uses these molecules to produce energy and to build and repair the body. Fat metabolism is a complex process involving many different chemical reactions.
