Molecular Biology of Plant Seed Development Brian A. Larkins, Indra K. Vasil, 2013-03-09 The beginnings of human civilization can be traced back to the time nearly 12 000 years ago when the early humans gradually changed from a life of hunting and gathering food to producing food This beginning of primitive agriculture ensured a dependable supply of food and fostered the living together of people in groups and the development of society During this time plant seeds were

recognized as a valuable source of food and nutrition and began to be used for growing plants for food. Ever since plant seeds have played an important role in the development of the human civilization. Even today seeds of a few crop species such as the cereals and legumes are the primary source of most human food and the predominant commodity in international agriculture. Owing to their great importance as food for humans and in international trade, seeds have been a favorite object of study by developmental biologists and physiologists, nutritionists and chemists. A wealth of useful information is available on the biology of seeds.

Seeds of Concern David Ronald Murray, 2003. How are genetically modified plants produced? Which breeding goals are worthwhile and which are not? Can the escape of transferred genes be controlled? Why have the first transgenic plants been released without full appreciation of the consequences? How dangerous are bacterial proteins produced in plant foods? Is anyone monitoring the unexpected effects of gene transfer? Will genetically modified plants ever be acceptable to organic growers? These are some of the important questions canvassed in this book, written with the insight of an experienced Australian plant scientist and conservationist.

Plant Reproductive Biology and Conservation Rupam Kapoor, Inderdeep Kaur, Monika Koul, 2016-12-14. Reproductive biology of plants is an emerging frontier area in plant sciences. Recent advances and research in this field are laying foundations for major conservation programmes initiated for protection of plant species all over the world. Reproductive mechanisms that operate in plants account for the diversity and evolution of many important families. The present volume is a compilation of eighteen chapters written by eminent scientists who work on various aspects of plant reproduction, conservation of species and molecular characterization of reproductive traits. It gives updated literature on the topics of academic and research interest. Also the endeavour is to incite inquisitive youngsters to pursue research in this field. The book is well illustrated and makes an interesting reference material for undergraduate as well as postgraduate students.

In Vitro Embryogenesis in Plants Trevor A. Thorpe, 2012-12-06. In vitro Embryogenesis in Plants is the first book devoted exclusively to this topic. As the ultimate demonstration of totipotency in plants, somatic and haploid embryogenesis is of vital importance to all those working on or interested in basic and applied aspects of plantlet information and regeneration. The text includes comprehensive reviews written by experts on all facets of in vitro and in vivo embryogenesis. Some chapters deal with the morphogenetic, structural and developmental, physiological and biochemical and molecular biological aspects of the subject. Chapters are also devoted to haploid embryogenesis, asexual embryogenesis in nature, zygotic embryogenesis and zygotic embryo culture. Detailed tables summarizing successful somatic embryogenesis in all vascular plants are also included. This book therefore brings together previously scattered information to provide an indispensable reference book for both active researchers, graduate students and anyone interested in this aspect of tissue culture technology and plant development.

Reproductive Biology of Angiosperms A Rashid, 2022-05-06. The present book entitled Reproductive Biology of Angiosperms is an up to date account of embryology, subject fortified with recent research on the subject as well as highlights the results of analytical disciplines.

Genomic Imprinting Rolf Ohlsson, 2013-06-29 The form and function of every living organism on the earth depends on the complex regulation of gene expression This is carried out by controlling and interdigitating spatial and temporal patterns of gene activity during the life time of eukaryotic organisms This is most dramatically apparent during early stages of development when new types of cells and organs are being formed often during very short time spans To achieve this it is vital that developmentally important genes can be kept in inactive or active states which are stably inherited in the soma Indeed it is now wellknown that the propensity for a gene to be transcribed or silenced is stably propagated through many cell generations even from parent to progeny This phenomenon constitutes a type of extragenetic or epigenetic memory of cell identity and developmental potential which has been fundamental to the evolution of complex lifeforms such as the reader of this book This monograph focuses on a particular aspect of the epigenetic control of gene function genomic imprinting This defines a phenomenon where some genes or whole chromosomes can be silenced activated or even deleted depending on their parental origin The impact of genomic imprinting is most clearly seen in the areas of cancer clinical genetics and development Many of the processes associated with genomic imprinting can be observed in plants yeast and man for example and may constitute therefore principles which are very conserved on an evolutionary scale
