KEY POINTS

- Nutritional support is increasingly recognized as an important aspect of management of critically ill patients
- The emphasis of nutritional support of critically ill patients centers on maintaining body condition and nutritional status, and not necessarily achieving weight gain
- As critically ill patients already have a high risk for developing complications, considerable efforts should be devoted to minimize nutrition-related morbidity
- Current emphasis in the provision of calories to critically ill animals is to start with the animal's resting energy requirements rather than overestimate calories by use of illness factors
- Whenever possible, the use of the enteral route is preferred to the parenteral route for nutritional support

During fasting in the healthy state, utilization of glycogen stores is the primary source of energy. However, glycogen stores are quickly depleted, especially in strict carnivores such as the cat, and this leads to the initial mobilization of amino acids from muscle stores. Within days, there is a metabolic shift towards the preferential use of stored fat deposits, sparing catabolic effects on lean muscle tissue. In diseased states, the inflammatory response triggers
