**A Guide to Modula-2** Kaare Christian,2012-12-06 Modula 2 is a simple yet powerful programming language that is suitable for a wide variety of applications It is based on Pascal a successful programming language that was introduced in 1970 by Niklaus Wirth During the 1970 s Pascal became the most widely taught programming language and it gained acceptance in science and industry In 1980 Dr Wirth released the Modula 2 programming language Modula 2 is an evolution of Pascal It improves on the successes of Pascal while adding the MODULE a tool for expressing the relations between the major parts of programs In addition Modula 2 contains low level features for systems programming and coroutines for concurrent programming Programming languages are important because they are used to express ideas Some programming languages are so limited that certain ideas can t be easily expressed For example languages that lack floating point arithmetic are inappropriate for scientific computations Languages such as Basic and Fortran that lack recursion are unsuitable for text processing or systems programming Sometimes a programming language is useable for a certain appli

cation but it is far from ideal A good example is the difficulty of writing large programs in pure Pascal Pascal is a poor language for large jobs because it lacks facilities for partitioning a program viii Preface 6 *Whitaker's Books in Print*, 1990

### **Software Maintenance - A Management Perspective**

Phaneendra Nath Vellanky, 2007-10-23 Computer systems play an important role in our society Software drives those systems Massive investments of time and resources are made in developing and implementing these systems Maintenance is inevitable It is hard and costly Considerable resources are required to keep the systems active and dependable We cannot maintain software unless maintainability characters are built into the products and processes There is an urgent need to reinforce software development practices based on quality and reliability principles Though maintenance is a mini

development lifecycle it has its own problems Maintenance issues need corresponding tools and techniques to address them Software professionals are key players in maintenance While development is an art and science maintenance is a craft We need to develop maintenance personnel to master this craft Technology impact is very high in systems world today We can no longer conduct business in the way we did before That calls for reengineering systems and software Even reengineered software needs maintenance soon after its implementation We have to take business knowledge procedures and data into the newly reengineered world Software maintenance people can play an important role in this migration process Software technology is moving into global and distributed networking environments Client server systems and object orientation are on their way Massively parallel processing systems and networking resources are changing database services into corporate data warehouses Software engineering environments rapid application development tools are changing the way we used to develop and maintain software Software maintenance is moving from code maintenance to design maintenance even onto specification maintenance Modifications today are made at specification level regenerating the software components testing and integrating them with the system Eventually software maintenance has to manage the evolution and evolutionary characteristics of software systems Software professionals have to maintain not only the software but the momentum of change in systems and software In this study we observe various issues tools and techniques and the emerging trends in software technology with particular reference to maintenance We are not searching for specific solutions We are identifying issues and finding ways to manage them live with them and control their negative impact
