

NORTH AMERICA

IN THE AGE OF DINOSAURS

By [Name] and [Name]

A million years ago, the continent of North America was a vast, unbroken landmass, teeming with life. From the towering mountains of the west to the vast plains of the east, a diverse array of dinosaurs roamed the land. In the water, marine reptiles and fish thrived, while in the air, pterosaurs soared. This was a time of great change, as the forces of nature shaped the continent into the land we know today.

THE CONTINENT'S MAKEUP

During the Mesozoic era, North America was composed of several distinct landmasses. The western part of the continent was dominated by the supercontinent of Pangea, which included the vast interior of North America. To the east, the Atlantic Ocean separated the continent from Europe and Africa. The Gulf of Mexico and the Caribbean Sea were also present, though their shapes were different from today's.

THE WESTERN FRONTIER

The western part of North America was a land of extremes. In the west, the towering mountains of the Sierra Nevada and the Rocky Mountains rose from the plains. These ranges were home to a variety of life, including large herbivores like the mammoth and the bison. In the east, the vast plains were a haven for large predators like the T-Rex and the Triceratops.

The central part of the continent was a vast, open plain, home to a variety of life. In the north, the great rivers of the continent flowed from the mountains to the sea. In the south, the vast plains were a haven for large predators like the T-Rex and the Triceratops.

THE SOUTHERN FRONTIER

The southern part of North America was a land of extremes. In the south, the vast plains were a haven for large predators like the T-Rex and the Triceratops. In the north, the great rivers of the continent flowed from the mountains to the sea. In the south, the vast plains were a haven for large predators like the T-Rex and the Triceratops.
