

A huge school of silversides attracts piscivores from far and wide

Piscivores

Even though prey and predators share reefs, it is uncommon to see a fish eat another fish. Barracudas and groupers seldom waste energy making random strikes in broad daylight. Their prey are too accomplished at surviving in a world of big mouths and sharp teeth for the hunters' conspicuous attacks to be effective. The grunts hovering together near to the reef instinctively understand, like all schooling fishes, that there is security in numbers. Their close parallel formation and bold stripes make it difficult for predators to single out targets. Every eye tracks the movement of passing piscivores; before a split-second

Right: Flatfish have evolved numerous defenses against piscivores.

Flat fishes often paravertex

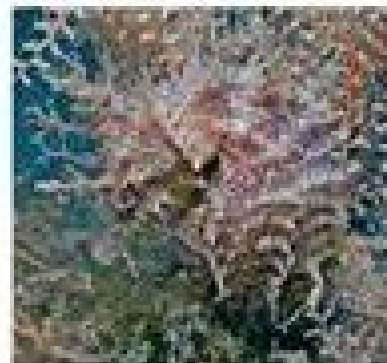

Parrot Grunts schooling for safety

A distinctive bordercaul spine

A flatfish inflates its body

A lined Grunts stays on camouflage

Parrotfish escape by diving into the sand

Reef Fish Behavior Florida Caribbean Bahamas

David W. Behrens
