Loss Of Habitat:

Deforestation and Habitat Loss Jaime Simmons, 2017-12-15 Forests are essential to human and animal survival. Trees produce the oxygen animals need to live. They also provide homes for animals and resources for people. However, Earth's forests are under attack. Deforestation is caused by fires, clear cutting, logging, and climate change. Forests are important to mitigating climate change because they suck up harmful carbon dioxide. Without forests, many plant and animal species would be at risk of becoming endangered or extinct. Complete with manageable text and stunning photographs of forests both healthy and threatened, this book covers essential concepts featured in elementary earth science curricula. Habitat Fragmentation and Landscape Change David B. Lindenmayer, Joern Fischer, 2013-02-22 Habitat loss and degradation that comes as a result of human activity is the single biggest threat to biodiversity in the world today. Habitat Fragmentation and Landscape Change is a groundbreaking work that brings together a wealth of information from a wide range of sources to define the ecological problems caused by landscape change and to highlight the relationships among landscape change, habitat fragmentation, and biodiversity conservation. The book synthesizes a large body of information from the scientific literature, considers key theoretical principles for examining and predicting effects, examines the range of effects that can arise, explores ways of mitigating impacts, reviews approaches to studying the problem, discusses knowledge gaps and future areas for research and management. Habitat Fragmentation and Landscape Change offers a unique mix of theoretical and practical information, outlining general principles and approaches and illustrating those principles with case studies from around the world. It represents a definitive overview and synthesis on the full range of topics that fall under the widely used but often vaguely defined term habitat fragmentation. A Resource-Based Habitat View for Conservation Roger L. H. Dennis, 2012-04-10 Winner of the Marsh Book of the Year Award 2012 by the British Ecological Society. In A Resource Based Habitat View for Conservation, Roger Dennis introduces a novel approach to the understanding of habitats based on resources and conditions required by organisms and their access to them: a quantum shift from simplistic and ineffectual notions of habitats as vegetation units or biotopes. In drawing attention to what organisms actually use and need in landscapes, it focuses on resource composition, structure, and connectedness, all of which describe habitat quality and underpin landscape heterogeneity. This contrasts with the current bipolar view of landscapes made up of habitat patches and empty matrix, but illustrates how such a metapopulation approach of isolated patchworks can grow by adopting the new habitat viewpoint. The book explores principles underlying this new definition of habitat and the impact of habitat components on populations, species distributions, geographical ranges, and range changes, with a view to conserving resources in landscapes for whole communities. It does this using the example of butterflies, the most alluring of insects, flagship organisms and key indicators of environmental health in the British Isles where they have been studied most intensively. The book forms essential reading for students, researchers, and practitioners in ecology and conservation, particularly those concerned with managing sites and
