Rhumb Lines and Map Wars Mark Monmonier, 2010-11-15 In Rhumb Lines and Map Wars Mark Monmonier offers an insightful richly illustrated account of the controversies surrounding Flemish cartographer Gerard Mercator s legacy He takes us back to 1569 when Mercator announced a clever method of portraying the earth on a flat surface creating the first projection to take into account the earth s roundness As Monmonier shows mariners benefited most from Mercator s projection which allowed for easy navigation of the high seas with rhumb lines clear cut routes with a constant compass bearing for true direction But the projection s popularity among nineteenth century sailors led to its overuse often in inappropriate non navigational ways for wall maps world atlases and geopolitical propaganda Because it distorts the proportionate size of countries the Mercator map was criticized for inflating Europe and North America in a promotion of colonialism In 1974 German historian Arno Peters proffered his own map on which countries were ostensibly drawn in true proportion to one another In the ensuing map wars of the 1970s and 1980s these dueling projections vied for public support with varying degrees of success Widely acclaimed for his accessible intelligent books on maps and mapping Monmonier here examines the uses and limitations of one of cartography s most significant innovations With informed skepticism he offers insightful interpretations of why well intentioned clerics and development advocates rallied around the Peters projection which flagrantly distorted the shape of Third World nations why journalists covering the controversy ignored alternative world maps and other key issues and how a few postmodern writers defended the Peters worldview with a self serving overstatement of the power of maps Rhumb Lines and Map Wars is vintage Monmonier historically rich beautifully written and fully engaged with the issues of our time

Computer science provides a powerful tool that was virtually unknown three generations ago. Some of the classical fields of knowledge are geodesy, surveying, cartography, and geography. Electronics have revolutionized geodetic methods. Cartography has faced the dominance of the computer that results in simplified cartographic products. All three fields make use of basic components such as the Internet and databases. The Springer Handbook of Geographic Information is organized in three parts: Basics, Geographic Information, and Applications. Some parts of the basics belong to the larger field of computer science. However, the reader gets a comprehensive view on geographic information because the topics selected from computer science have a close relation to geographic information. The Springer Handbook of Geographic Information is written for scientists at universities and industry as well as advanced and PhD students. **Navy Department Bureau of Naval Personnel Readings on the Foundations of National Power** United States.
