broadcast industry an authoritative guide to the Radio Data System RDS also called Radio Broadcast Data System RBDS

Since the standard's adoption about 700 stations have begun broadcasting RDS in the United States. There is a wide variety of encoding equipment with prices starting as low as 400 and over 30 models of RDS receivers have been introduced for cars, home receivers, portable and even PC receivers. Automobile manufacturers such as General Motors, Ford, Audi and Porsche now offer RDS on new vehicles. Yet despite all the support equipment in place, the FM broadcaster has been reluctant to implement and utilize this service mainly because of a lack of understanding of what RDS can do for the station. This book finally provides the information required to understand RDS and its possibilities on a variety of levels so that everyone involved in radio can make the most of it. Station owner, program director, salesperson and talent alike will find the information he or she requires to maximize the possibilities of this new technology. Each feature of the system is explained in terms of its practical implementation at the station and interviews with broadcasters currently using the system add a hands-on perspective. Scott Wright is a recognized pioneer in RDS development. As the designer of Delco Electronics' first RDS receiver, he has been extremely active in the development of the RDS standard in the US and in efforts to educate the broadcast community about its potential. He has represented Delco at the European Broadcasting Union's EBU RDS Forum and is currently the Chairman of the National Radio Systems Committee RBDS Subcommittee, the US standard setting body. He is also a member of the Electronics Industries Association's EIA RDS Forum.

Networks Daniel Hardy, Guy Malleus, Jean-Noel Mereur, 2013-12-18. Revolution, transformation, upheaval and promise. Yesterday the technologies of communication were accessible only to experts; today they are a subject of constant discussion in the media. New services are advertised on a daily basis and the potential realized or not of these technologies is a constant source of comment and discussion. But beyond the media frenzy, things really are developing with increasing speed, driven by the power of the Internet. The network has built up an ongoing relationship between research centres, development teams and marketing teams, allowing a constructive collaboration between technologies. The network has become the catalyst for its own evolution. The arrival of IP and GSM has given rise to new corporate giants like Cisco Systems and Nokia. Operators, witnessing the diversification of their main sources of revenue, have been forced to merge or split. Entirely new actors from various horizons are counting on their ability to act as operators without a network to their name. Traditional equipment manufacturers have had to rethink their product lines in view of these new foundations. Likewise, governments have understood the need to create a body of laws that promote the harmonious and rapid development of networks to offer alternatives for operators and service providers. These often complex regulations act both as constraint and opportunity for operators and give direction to the actions of actors across the board.
