Tornadoes

A Devastating Force on Earth

Tornadoes are interesting but very dangerous. They most often occur in the spring and summer in the Great Plains states in the U.S. Tornadoes are highly damaging. This makes them one of the most devastating forces on

Earth. Usually form during giant thunderstorms. They occur when warm, moist air from the Gulf of Mexico mixes with cold, dry air from Canada. As the warm air rises and cools, it forms a supercell. A supercell is a large thunderstorm. The supercell rotates at different speeds. This creates a spinning effect of air. Known as wind shear. These unstable weather conditions can cause air to rotate up to form. When this happens, a funnel cloud develops. This is the core of a tornado. Sometimes these dark, cone-shaped clouds stretch far enough to touch the ground. When they do, massive damage to anything in its path occurs.

Tornadoes can move 30-70 miles per hour and destroy everything in their path. They can drop buildings as far as 100 feet. Tornadoes can also move faster with so much force that it sticks into tree trunks. Most tornadoes only last a few minutes. But high-speed winds can break apart buildings, knock down trees, and lift cars into the air. The wind

Tornadoes swirl up and carry debris up to 100 miles away.

MARK It Up!

Read and Annotate

- ☒ Draw a star near important facts and details.
- ☐ Circle important words and phrases.
- ☐ Put a question mark near details you find confusing or have questions about.
- ☐ Put an exclamation mark near details you find surprising or interesting.
- ☐ Underline unfamiliar words or phrases.
